STRATEGIC SITES INVENTORY PROGRAM

Core Suitability Modeling is a GIS-based land use and logistics-driven analysis tool driving the site search efficiency unique to the SSI Program. A suite of eight core models provide the versatility to analyze location suitability for a diverse set of industry sectors. Each core model is defined by a project land use and includes up to four transportation scenarios. This allows strategic site searches to be customized for each community to align with transportation assets and viable target industries. Objective and a-political, Core Suitability Modeling defines site quality through a complex set of industrial and commercial location competitiveness factors.

Core Suitability Models consider a wide array of location and performance factors (inputs) relevant to site physical characteristics, surrounding land use compatibility, transportation access, and environmental, ecological, and cultural sensitivities. Inputs represent attractive and vulnerable criteria such as interstate, multi-lane divided highway, Class I rail, navigable waterway/port, flood risk, elevation/slope, potential wetlands, soil conditions, etc. Spatial analysis is used to derive numerical values for site suitability inputs. Inputs are weighted for model influence and mathematically summed to produce a composite location score (e.g., geographic suitability index). Each Core Suitability Model index is visualized as a color-coded heat map suggesting geographic areas where features and conditions are suitability for sector-specific industrial or commercial development.

A precursor to subjective site quality screening, Core Suitability Modeling greatly minimizes the geography for quality greenfield site exploration. Modeling suggests optimal locations for facility permitting, construction, and operation while protecting sensitive environmental, ecological, and cultural resources. Informed by 20+ years of industrial site selection experience, industry sector models are built on multi-disciplined engineering and environmental regulatory compliance expertise. The highly technical and data-driven nature of SSI Core Suitability Modeling results in a high site due diligence survival rate.

COUNTY-LEVEL CORE SUITABILITY MODELS

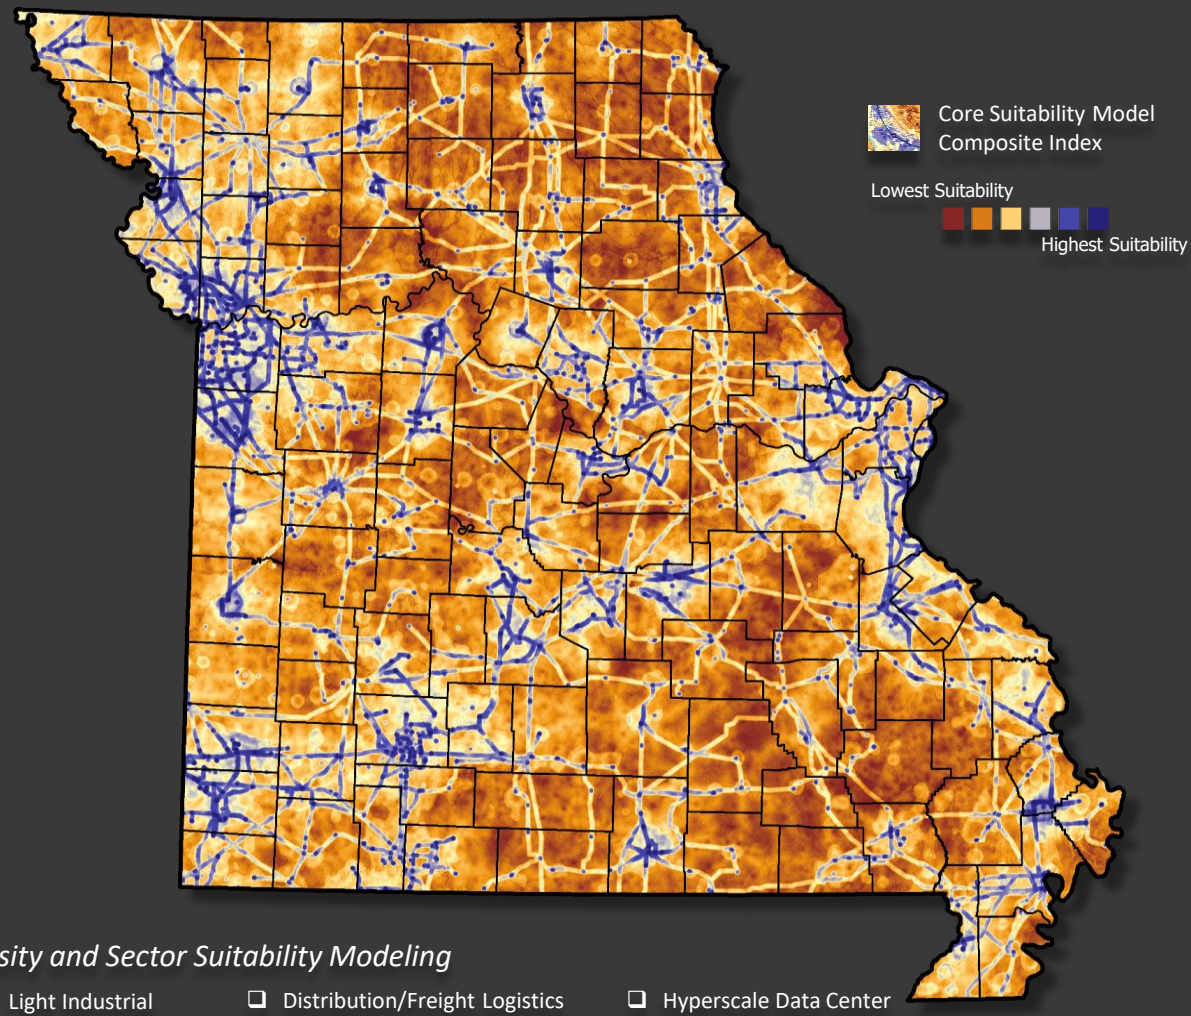

Heavy Industrial | Light Industrial | Distribution/Freight Logistics

SSI Sector Suitability Modeling

Missouri

Project Land Use: Hyperscale Data Center

Project Land Use Intensity and Sector Suitability Modeling

- ❑ Industrial Megasite
- ❑ Tech MegaPark
- ❑ Heavy Industrial
- ❑ Light Industrial
- ❑ Heavy Agribusiness
- ❑ General Agribusiness
- ❑ Distribution/Freight Logistics
- ❑ R&D/Technology
- ❑ Business Park/Medical
- ❑ Hyperscale Data Center
- ❑ Utility-scale Solar
