Introduction

This report presents the findings of the Strategic Sites Inventory (SSI) Phase II: Preliminary Due Diligence assessment of Site ID 18121-004 (referred to as the "Montezuma Industrial Site"), a 241.6-acre greenfield property located near the town of Montezuma in Parke County, Indiana. Montezuma is located near the larger town of Rockville, which serves as the county seat. The Montezuma Industrial Site was nominated for advancement to SSI Phase II by officials from Parke County (Partnership Parke County) and Wabash Valley Power Authority (WVPA). WVPA is a non-profit electric cooperative serving an alliance of 23 member distribution co-ops across Indiana, Illinois, and Missouri. *The subject site satisfies baseline quality criteria, aligns with Parke County industry targets, and is deemed competitive to attract high-value business investments in support of sustainable community job growth and economic prosperity.* Report site maps are included as **Appendix A**.

SSI QUALIFIED SITE

The SSI Program is an advance site selection initiative designed to develop an inventory of strategic real estate assets to attract quality job-creating business investments. In 2019, the Indiana Economic Development Corporation (IEDC) initiated the Strategic Sites Inventory (SSI) Program in the State of Indiana with *SSI Phase I: Site Discovery* for all 92 counties with a goal to increase economic development competitiveness at the community level by identifying new, top quality raw land sites ideally suited for industrial and commercial projects. Parke County was included in the initial IEDC-funded project and benefitted from the identification of two potential high-value sites for mega site and heavy industrial land uses. A subsequent investment by IEDC in 2020 included expanded SSI Phase I site searches to identify light industrial and agribusiness sites, increasing Parke County's total of quality SSI-identified sites to ten. A total of 463 sites have been identified within WPVA's served territory.

Site ID 18121-004 was identified from the expanded 2020 IEDC-funded SSI Phase I project for light industrial and agribusiness land uses. The subject site exhibits necessary competitive characteristics for SSI Phase II: Preliminary Due Diligence nomination. Leotta Location and Design's SSI Phase II Candidate Site Index was designed to assist clients and communities with nominating the highest quality sites for advancement to SSI Phase II. According to this indexing system, the subject site qualifies as Parke County's top WVPA-served priority site. The indexing process assigns an a-political score, or Composite Score, for SSI Phase I sites to provide a relative indication of site strength for advancement to Phase II. The subject

site received a Composite Score of 86 out of 100. Details about the SSI Program phases are provided in **Appendix B**. The Parke County SSI Phase II Candidate Site Index overview is provided as **Appendix F**.

Leotta Location and Design (LL+D) has developed a systematic and effective methodology for screening potential sites for practical development as part of the SSI Phase II process. LL+D's site screening methodology is informed by fifteen-plus years of industrial and commercial site selection experience and economic development consulting in conjunction with demonstrated geospatial technology-based analysis and mapping expertise. LL+D staff and consulting partners include environmental science, civil and geotechnical engineering, landscape architecture, geospatial technologies, and economic devolvement experts who combine disciplines to identify and evaluate sites for industrial and commercial project uses.

The purpose of the SSI Phase II study is to provide a quantitative understanding of the subject site's advantages and challenges in conjunction with a rough order-of-magnitude (ROM) cost estimate to improve site functional use and mitigate development challenges. The SSI Phase II study is a desktop-based preliminary engineering and environmental due diligence exercise performed by discipline-specific experts with experience in industrial and commercial site selection and property development. Study of the subject site's physical and surrounding characteristics, assets, and impediments for development are reviewed in sufficient detail to formulate a defendable opinion on the competitive strength of the property for an economic development use.

The SSI Phase II study is intended to expose any potential "fatal flaws" that indicate significant development incumbrances or grossly compromise site competitiveness. The desktop review relies on an array of engineering, environmental, ecological, and cultural GIS data in conjunction with aerial imagery and available public records to assess current site development advantages and challenges. The SSI Phase II assessment concludes with the formulation of ROM cost estimates for improving site functional use and mitigating any potential development challenges.

LL+D's team of site selection and economic development experts provided an in-depth study of the subject site through an objective measure of physical features and surrounding characteristics and conditions across engineering, environmental, ecological, and cultural concerns. Overall site competitiveness for an economic development land use is made within the context of location requirements for permitting, construction, and operations relevant to the intended site project land use.

The SSI Phase II findings are expressed along three principal site assessment parameters:

Condition of the site's physical characteristics including assessment of engineering and environmental development advantages and challenges.

Connection to transportation assets, utility infrastructure, and major market areas.

Community support including available workforce, cultural feature impacts, and business climate for economic development.

A description of the subject site and summary of SSI Phase II findings is provided below.

Site Description

The Montezuma Industrial Site is an undeveloped (greenfield) property approximately 241.6 acres in total size located adjacent to U.S. Highway 36 (US-36) and along County Road 600 West (CR-600 W) and West County Road 40 North (W CR-40 N) just outside the town of Montezuma, Indiana. The subject site is comprised of four tax parcels, or tracts, independently owned by one landowner of record. **Appendix C** provides a summary of site parcel ownership information.

Site ID 18121-004 south view from US-36.

Current site condition is characterized by farmed agricultural land for the entirety of the site. The property has historically been used for crop production. There are no structures currently observed onsite. Land use surrounding the site is primarily agricultural and forested with some commercial/light industrial and residential land use within a mile. Residential properties are few surrounding the site, and one residential property is located adjacent to the site at its northeastern corner. Nearby businesses include Parke County Aggregates LLC (a sand and gravel mining operation), Park City Veneer, Biginch Fabricators & Construction, and Ceres Solutions. Commercial or residential activity near the site presents no significant impact.

The cultural setting is rural with the town of Montezuma located within a mile northwest of the subject site. The site is directly bordered by US-36 to the north, CR- 600 W to the west, and W CR-40 N to the south. *A contiguous "buildable area" was defined within the confines of the subject site boundary intended to be most advantageous for construction. The Montezuma Industrial Site buildable area is approximately 210.9 acres and encompasses the majority of total site acreage. The buildable area has been defined to avoid wet areas and a residential buffer zone.*

Geographic Location

Located in West Central Indiana, Parke County provides a rural setting within proximity to a metropolitan area. The county is situated near the state line of Indiana and Illinois between the high-commercial activity I-74 and I-70 corridors with access to major markets throughout both states. The I-70 corridor connects Indianapolis, IN to St. Louis, MO. *In direct linear measure, the site is situated approximately 21 miles north of Terre Haute, IN; 60 miles west of Indianapolis, IN; 52 miles southeast of Champaign, IL; 122 miles east of Springfield, IL; 144 miles south of Chicago, IL; and 170 miles northeast of St. Louis, MO.* Projects considering the Montezuma Industrial Site will benefit from locating in a rural community largely avoiding traffic congestion, cumbersome permitting processes, and higher land costs typical of urbanized areas while being within reach of a metropolitan community strongly embedded in economic growth and

prosperity amongst a primary network of connectivity. Access to surrounding labor markets at competitive wage rates is within reach of the subject site. Workforce in relation the subject site is relatively low. A map of site proximity to major metropolitan areas is provided in **Appendix A**.

The subject site is located outside the municipal limits of the town of Montezuma, which has a 2020 estimated population of 921. Montezuma is part of the Reserve Township, one of thirteen townships in the county that has a population of approximately 1,423. Rockville serves as the county seat for Parke County, which has an estimated county population of 16,407. *More than 218,385 total residential population live within a 45-minute drive of the site. Approximately 12,823 businesses employing 165,651 people are located within a 60-minute travel time.* Construction, manufacturing, and professional, scientific, & technical services account for 16.3% of businesses employing 27.1% of total workforce within a 60-minute drive of the site. A site vicinity map is provided in **Appendix A**.

Site ID 18121-004 Site Vicinity

Current Ownership

The subject site is comprised of four contiguous tax parcels, or tracts, and is reported by Parke County officials to have a single owner. *According to county-provided information, the current owner of record is Winterberg, LLC. The subject site is comprised of four tracts of approximately 116.52, 71.56, 43.05, and 12.02 acres according to Esri GIS data.* Parke County economic development officials have stated that the landowner is not currently promoting the site for sale. As of the date of this report, no known real estate purchase option agreement is held with any person or organization with the landowner for any portion of the site. *LL+D strongly recommends that Parke County pursue and secure a real estate purchase option agreement with the landowner. This is critically important to reduce uncertainty regarding property availability and price*. A "Site Parcel Configuration" map is included in **Appendix A**.

Findings Summary

The findings from the SSI Phase II study are summarized below. A discussion of key site development considerations is provided within the context of overall site physical **condition**, **connection** to infrastructure, and **community** support. LL+D's site competitiveness assessment across these key site development parameters are presented below.

Condition

Site conditions are defined as the physical characteristics of the subject property including geometric configuration, surface features, engineering, ecological and environmental concerns, and land use compatibility. *Overall, conditions for the Montezuma Industrial Site are favorable for development for the site's highest and best use as an economic development real estate asset*.

Size and Configuration of the subject site is sufficient in both acreage and configuration to support a *Light Industrial or General Agribusiness operation. Total site area is approximately 241.6 acres, measuring approximately 2,558 feet across an east-west axis at its widest point and approximately 4,151 feet across a north-south axis*. The site is geometrically regular in configuration with adequate land between site boundaries providing ample acreage for a contiguous buildable area. The northern site boundary is bordered by U.S. Highway 36 (US-36), the site's primary access road. County Road 600 W (CR-600 W) runs parallel to the site's western boundary and provides the site with an adequate route for truck traffic.

A contiguous buildable area totaling 210.9 acres has been defined to optimize facility construction on the site by positioning an operational footprint to avoid wet areas and a residential buffer zone. The buildable area occupies the majority of the site and is comprised of a single tract. Site access is supported by multiple potential ingress/egress points located on US-36 along the site's northern boundary and CR-600 W along the site's western boundary.

Hydrography and Flood Risk were evaluated by consulting USGS National Hydrography Dataset (NHD), a geospatial database which identifies stream segments or reaches that make up the nation's surface water drainage system, and FEMA National Flood Hazard Layer (NFHL), a geospatial database that contains current effective flood hazard data. *Based on a review of NHD and NFHL data, the site and buildable area are highly favorable for site development with low flood risk and minimal recorded/observed significant hydrography features. 100% of the site is outside the FEMA-designated flood hazard area and is designated as Flood Zone X (within 0.2-percent-annual-chance flood or 500-year floodplain). The site is within approximately 200 feet of Flood Zone A across County Rd 600 to the west. However, this is not seen as a threat to the subject site since the site sits approximately 40 feet higher than the area in the flood zone.* A hydrography and FEMA flood hazard map is provided in **Appendix A**.

Potential Wetlands are interpolated through observation of multiple data inputs including:

1) USGS National Wetlands Inventory (NWI) – developed for non-404 jurisdictional wetland mapping, so must be understood to have limited accuracy
2) LiDAR-derived digital elevation model (DEM) – topography/elevation
3) USGS NHD – hydrography
4) NRCS SSURGO – soils data provides hydric rating
5) Color-infrared imagery (where available) – for visual indication of wet or inundated areas (consulting differing years to ensure wet areas are not the result of a period flood event)

The NWI data is consulted as the principal indicator of potential wetlands, as the mapping methodology utilizes the above-referenced inputs in addition to other data sources in conjunction with qualified

scientific review and quality control of interpolated wetlands delineation and taxonomy. The NWI data also provides a delineation of wetland types, which is important in the estimation of permitting burden and potential compensatory mitigation costs. The additional data sources are consulted to ensure congruency of information suggestive of potential wetlands occurrence.

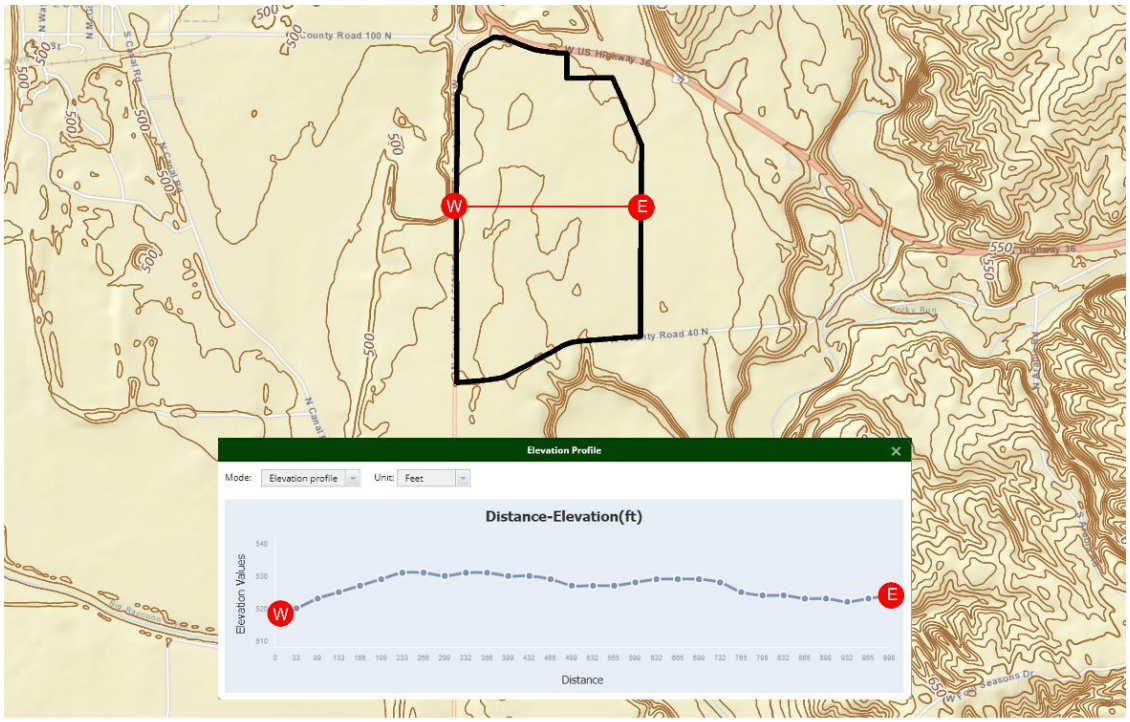

From the US EPA Wetland Regulatory Authority fact sheet, wetlands subject to Clean Water Act Section 404 are defined as "areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." There are three primary conditions required for surface areas to be considered wetlands: 1) at least periodically, the land supports predominantly hydrophytes, 2) the substrate is predominantly undrained hydric soil, and 3) the substrate is saturated with water or covered by shallow water at some time during the growing season of each year. As determined by the U.S. Army Corps of Engineers, the federal agency responsible for enforcing federal laws protecting wetlands, an area must exhibit all three of the above-referenced conditions to be considered a wetland.

The following GIS-based information was consulted for the desktop wetlands assessment:

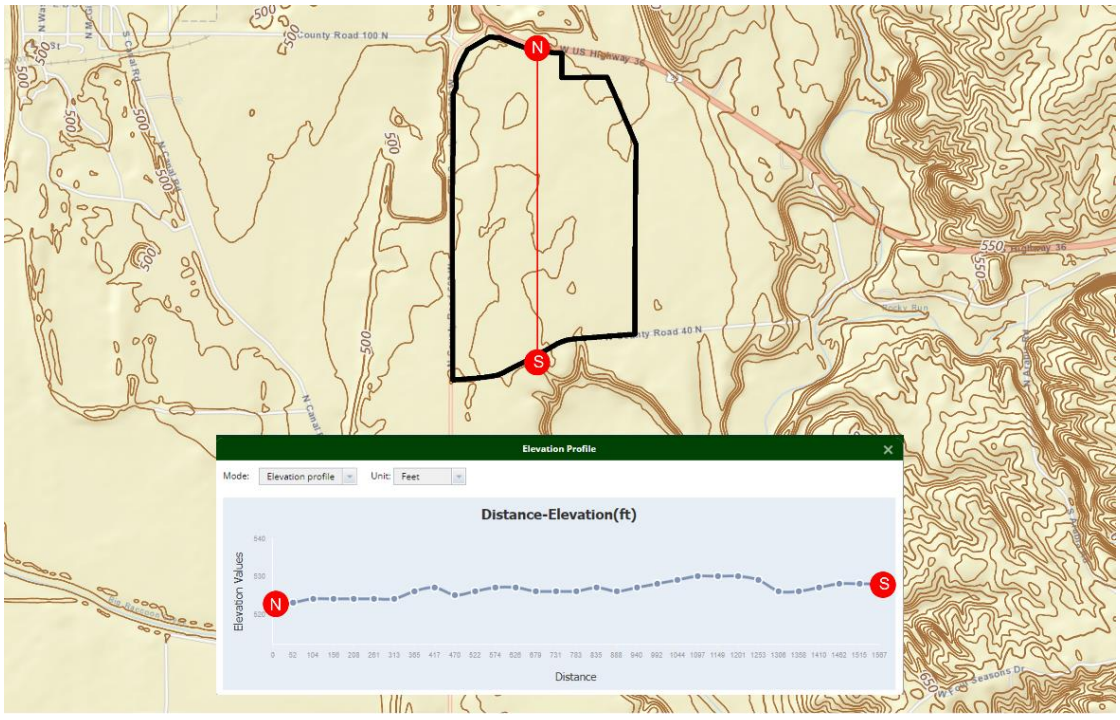

- **Hydrophytic Vegetation**: Recent and historical aerial imagery and NWI data.
- **Wetland Hydrology**: LiDAR-derived DEM, USGS topo maps, and high-resolution aerial imagery.
- **Hydric Soils**: NRCS Web Soil Survey and SSURGO data.

There are approximately 0.0 acres of potential wetlands reported on the subject site. The nearest wetland areas are located 700 feet south of the site and are classified as "freshwater forested/shrub" wetlands. According to the SSURGO Hydrologic Soil Group map, 6.7% of the total site has soils estimated to have hydric components. These soils are almost completely outside of the proposed buildable area and are located on the easternmost and westernmost portions of the site. While no potential wetlands are reported within the buildable area, wetland permitting and mitigation may be required on the subject site. This appears to pose minimal development impediments to the site. NWI potential wetlands map is provided as **Appendix A**.

Elevation/Topography presents minor grading challenges to prepare the site for development. *Based on a review of 5-meter cell size, LiDAR-derived digital elevation models (DEM) for the full site extent, a minimum elevation of 507 feet mean sea level (MSL) and maximum elevation of 533 feet MSL is reported. The 2019-2020 DEM indicates an average buildable area elevation of 514 feet MSL and average slope of 1.02 percent*.

18121-004 Elevation Profile West-East (USGS 3DEP Viewer)

18121-004 Elevation Profile North-South (USGS 3DEP Viewer)

The majority of the site is generally flat and without significant sloping. The lowest elevation occurs along the westernmost boundary; the central and southwestern portions of the site generally have higher elevation and less slope. With the flat topography, there are not likely many cut-fill opportunities for use of onsite fill for grading/leveling. This analysis is subject to an onsite geotechnical engineering investigation to determine suitability of soil properties for construction. Additionally, any areas of naturally occurring sloping topography may provide passive locations for site buildable area drainage and stormwater retention. A LiDAR-derived DEM and 10-ft contour map is provided as **Appendix A**.

Land Cover assessment is useful for identifying site design constraints and/or potential encumbrances that may be encountered during site development such as extensive clearing and grubbing, drainage concerns, etc. The vegetative cover type is used in conjunction with soil types, elevation, and hydrography data for interpretation of environmentally sensitive conditions such as wetlands and potential habitat for Threatened and Endangered (T&E) species and other species of concern (discussed later in this report). Certain land cover features may reveal commercial value of forested areas or be desirable to incorporate into the site design. Features such as densely wooded areas may provide a desirable buffer during construction and/or during facility operations for line of sight and noise control. Another example is integrating wetland areas into site plans, thus providing an element of design aesthetics.

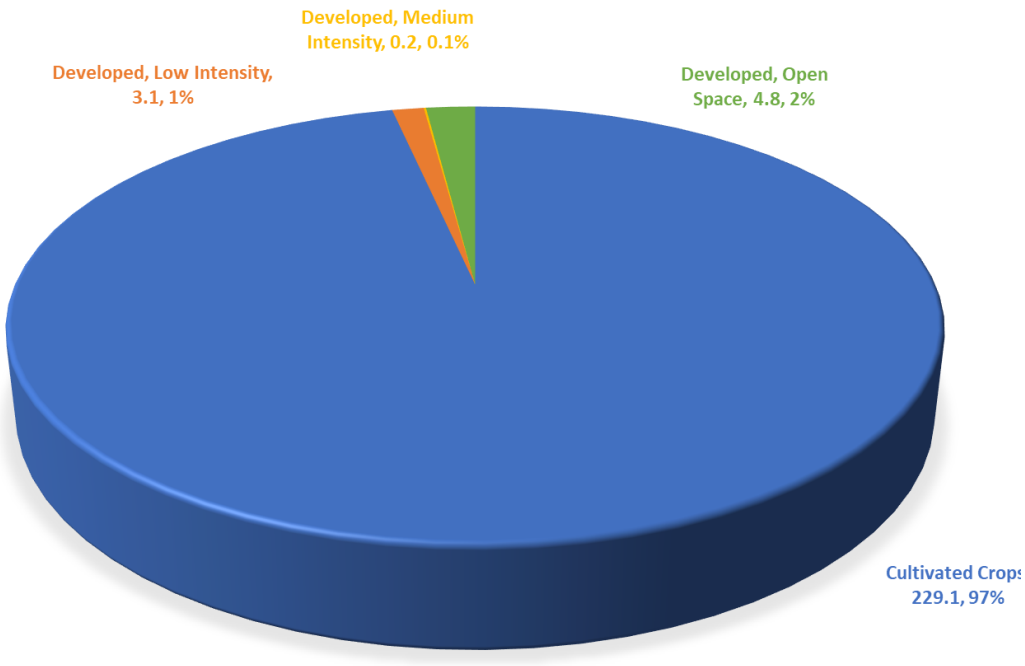

Two primary sources were used to assess land cover characteristics:

1) *Recent high-resolution color aerial imagery* (ESRI/Google Earth 2022). Recent and past aerial imagery provide useful observational data for assessing current land cover conditions, as well as any notable changes over time. However, aerial imagery alone cannot be used without additional data sources to provide a more specific delineation of land cover type. For example, densely wooded areas are readily observed from aerial imagery, however, determination of forest composition is largely indeterminate without other remotely sensed inputs (i.e., color infrared imagery) or ground-based observation.

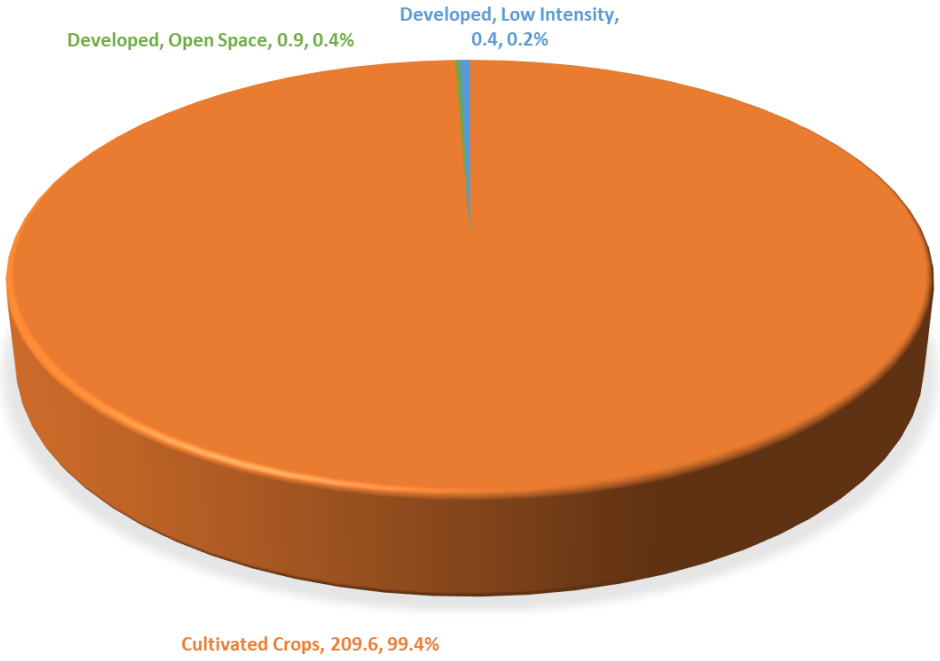

2) *The Multi-Resolution Land Characteristics Consortium (MRLC), National Land Cover Database (NLCD)*. The National Land Cover Database (NLCD) provides nationwide data on land cover and land cover change at a 30m resolution with a 16-class legend based on a modified Anderson Level II classification system. NLCD 2019 represents the latest evolution of NLCD land cover products focused on providing innovative land cover and land cover change data for the Nation. NLCD 2019 offers 8 integrated epochs of land cover for years 2001, 2004, 2006, 2008, 2011, 2013, 2016, and 2019. Developed classes in these years are directly derived from percent developed impervious surface and include a descriptor label that identifies the type of each impervious surface pixel. The NLCD Land Cover change index combines information from all years of land cover change and provides a simple and comprehensive way to visualize change from all 8 dates of land cover in a single layer.

Based on a review of the MRLC NLCD dataset, land cover for the site and buildable area consists of the following classified areas (acres, percent cover):

Land Cover – Site (acres, %)

Land Cover – Buildable Area (acres, %)

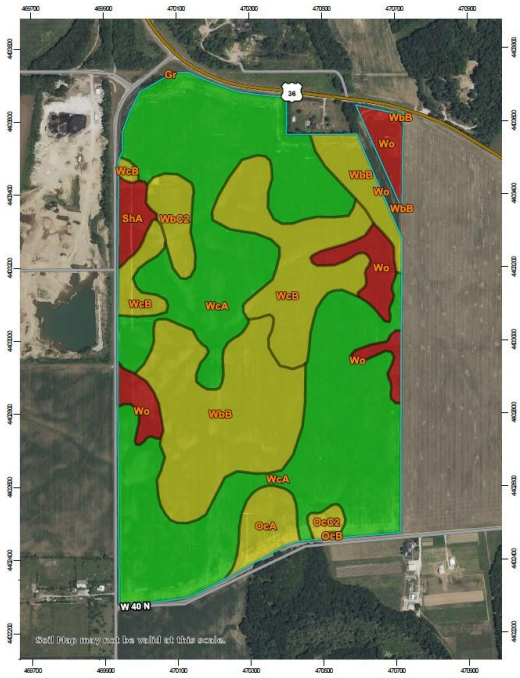

A Land cover map is provided in **Appendix A**.

Soils conditions are assessed to identify potential advantages and/or challenges that could have an impact on site design, construction, and overall use of the site. Soil types are evaluated with respect to drainage and engineering performance for excavations, road construction, and building foundation support. Additionally, hydric soil ratings are used in conjunction with wetlands data to increase confidence in potential wetlands interpretation (reported in previous section).

According to the United States Department of Agriculture (USDA), Natural Resource Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) accessed via the NRCS Web Soil Survey, *53.5% (129.2 acres) of the subject site soils are classified as "Warsaw silt loam, 0 to 2 percent slopes" with a drainage class of "Well drained." An additional 38.3% (92.4 acres) of the site has a rating of "well drained" with various types of Ockley silt loam and Warsaw loam soils. Somewhat poorly drained to poorly drained soil types including Sleeth loam and Westland silt loam make up the remaining 8.2% (20 acres) of the site.* These soils are assigned to SSURGO hydrologic soil groups and have slow infiltration rates with high runoff potential.

Soil suitability properties for small commercial building construction across 53.5% (129.2 acres) of the subject site are indicated as "Not limited" for shallow (2 feet deep) reinforced concrete spread footings. "Not limited" indicates that the soil has features that are very favorable for the specified use. An additional 38.3% (92.5 acres) is indicated as somewhat limited, meaning that the soil has features that are moderately favorable for the specified use. The limitations can be overcome or minimized by special planning, design, or installation. Fair performance and moderate maintenance can be expected.

The remaining 8.3% (19.9 acres) of the subject site is indicated as "Very limited" for shallow (2 feet deep) reinforced concrete footings. "Very limited" indicates that the soil has one or more features that are unfavorable for the specified use. The limitations generally cannot be overcome without major soil reclamation, special design, or expensive installation procedures. Poor performance and high maintenance can be expected.

The majority of the buildable area has soils that are very favorable for an industrial project land use. Good performance and very low maintenance can be expected. The onsite areas that contain soils with poor drainage class, hydric soils group, and limited small commercial building construction rating are primarily located outside of the buildable area on the easternmost and westernmost portions of the site. A SSURGO soils map is provided in **Appendix A**. The USDA, NRCR SSURGO soils reports for drainage class, small commercial buildings, and hydric rating are provided in **Appendix G**.

Sinkholes are common geological phenomenon occurring throughout the United States. They are only one of many kinds of karst landforms, which include caves, disappearing streams, springs, and underground drainage systems. Karst is a generic term which refers to the characteristic terrain produced by erosional processes associated with the chemical weathering and dissolution of limestone or dolomite.

The Sinkhole Areas and Sinking-Stream Basins Map developed by the Indiana Geological Survey shows the locations of sinkhole areas (SHA) and sinking-stream basins (SSB) in southern Indiana. Some sinkholes may exist outside the delineated areas, and some sinkholes may exist within the areas designated as sinking-stream basins, but such areas are not shown in this map. *The subject site lies entirely outside of the SHA and SSB areas, and thus should not be at risk of sinkholes.* The reliability of reported sinkhole occurrences is unknown. Potential site susceptibility to sinkholes must be determined through more thorough professional geological and geotechnical engineering investigation.

Zoning and Land Use is administered and governed by the Parke County Zoning Ordinance. *According to SSI Pre-Project Questionnaire, the site is currently zoned Agriculture. The questionnaire also states that Parke County has minimal zoning requirements.* A County Zoning Map is provided in **Appendix D.**

The apparent current land use of the subject site is derived from the SSI Pre-Project Questionnaire, 2019 Parke County Economic Development Plan, 2007 Parke County Comprehensive Plan, recent aerial imagery, and Google Street View. *Recent aerial imagery shows current land use to be agricultural/crop production as evidenced by minimal forested areas and lack of commercial structures*. *The aerial imagery-derived land use observations for the site agree with the 2019 Parke County Economic Development Plan and the 2007 Parke County Comprehensive Plan's Agricultural designation. It also matches the NLC Database – Cultivated Crops (97%) land cover classifications.*

Current land use immediately surrounding the subject site to the east, north, and south consists mainly of agricultural lands and residential properties. A gravel & sand mine and a hardwood sawmill are found west of the site across CR 600 W. There is a single residential structure adjacent to the site's northern boundary and US-36. There is also an out of use gravel pit just north of the subject site on a parcel owned by the Parke County Board of Commissioners. An analysis of the aerial imagery shows cleared areas and multiple storage piles on site.

There is little to no indication of other land uses over the last ninety-three years based on a review of historical aerial imagery dating to 1949 (provided by EDR Radius report). Eight epochs from 1949 to 2016 were reviewed to determine the sequential occupancy of the subject site. Since 1949, the subject site has been consistently used for agriculture. A small residential property was located on a portion of the site near the southwest boundary as recently as 1992. The next available image from 1998 shows that the structure was removed. While the history behind the structure is unknown, no issues with archaeological findings or historical structures are suspected. Historical aerial imagery is included in the EDR Radius Report provided as **Appendix H**.

Current site land use is ideal to support future development of the site for Industrial and manufacturing land uses. Surrounding tract land use is compatible with the intended site use immediately around the buildable area. The nearby future land use is indicated from the 2007 Parke County Comprehensive Plan

to be Industrial to the north and west and agricultural to the south and east. *Tracts surrounding the subject site, and especially the buildable area, should be considered for rezoning with uses that are compatible with the intended industrial uses of the site. Compatibility with surrounding land use is vital to preserving the competitiveness of the site for an economic development use by preventing encroachment of land uses that would create real or perceived risk to prospective business considering the site for development.*

Relevant excerpts from the 2019 Parke County Economic Development, the 2007 Parke County Comprehensive Plan and the Parke County Zoning Ordinance prescribing zoning and land use polices, standards, and statutory requirements for land development are included in **Appendix D**. Officials from Parke County Planning & Zoning should be consulted for detailed requirements pertaining to land use and zoning district designations.

Threatened and Endangered Species are defined under the federal Endangered Species Act (ESA) of 1973. The ESA provides a program for the conservation of threatened and endangered (T&E) plants and animals and the habitats in which they are found. The lead federal agencies for implementing ESA are the U.S. Fish and Wildlife Service (USFWS) and the U.S. National Oceanic and Atmospheric Administration (NOAA) Fisheries Service. The USFWS maintains a worldwide list of endangered species. Species include birds, insects, fish, reptiles, mammals, crustaceans, flowers, grasses, and trees.

The ESA defines an *endangered species* as "any species which is in danger of extinction throughout all or a significant portion of its range." Endangered species are automatically protected by prohibitions of several types of "take," including harming, harassing, collecting, or killing, under Section 9 of the ESA. There are some limited exceptions to these rules listed in Section 10 of the ESA. The ESA defines a *threatened species* as "any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Threatened species receive protections through separate regulations issued under Section 4(d) of the ESA.

LL+D staff consulted the USFWS Information for Planning and Consultation (IPaC) online tool (https://ipac.ecosphere.fws.gov/) to assess potential project effect on listed species (*a plant or animal that receives federal protections under the Endangered Species Act. Species can be protected as endangered or threatened*) and other USFWS trust resources (*includes migratory birds, species listed as threatened and endangered under the Endangered Species Act, interjurisdictional fishes, marine mammals, wetlands, and lands managed by USFWS, such as national wildlife refuges*). The IPaC tool is a project planning tool that streamlines the USFWS environmental review process.

An IPaC Resource List was generated for the subject site. The Resource List is a report that automatically generates a list of species and other resources such as critical habitat (collectively referred to as trust resources) under USFWS jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

The IPaC trust resources report lists critical habitats and species of concern known or suspected to be found in habitats within regional ecology. The IPaC trust resources report found that the following species may potentially be affected by activities in this location:

- **Mammals**:
  - Indiana Bat (*Myotis sodalist*) – Endangered
  - Northern Long-eared Bat (*Myotis septentrionalis*) – Endangered
- **Insects**:
  - Monarch Butterfly (*Danaus plexippus*) – Candidate
- **Critical Habitats**:
  - There are no critical habitats at this location.

The IPaC report also identifies the Migratory Birds Resource List that identifies certain birds protected under the Migratory Bird Treaty Act of 1918 and the Bald and Golden Eagle Protection Act of 1940. Birds listed in the report are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention within the subject site location. The report does not include a list of every bird found within the site location, nor a guarantee that every bird on this list will be found within the site. The migratory bird list is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and altered to return a list of those birds reported as occurring in the 10km grid cell(s) that intersect the specified site study area location and have been identified as warranting special attention because they are a BCC species or an eagle (Eagle Protection Act requirements may apply) in that area.

The IPaC Migratory Birds Resource List (MBRL) provides a "Probability of Presence" summary indicating the best understanding of when birds of concern are most likely to be present in the site area. *While there is no immediate known impact to site development, the MBRL should be further reviewed within the context of environmental permitting requirements by a qualified environmental/ecological consultant, as temporal migratory bird presence may affect the timing of certain construction-related activities on the subject site*. The IPaC trust resources report is provided in **Appendix E**.

Legacy Environmental Concerns consist of historical activities and events both on the subject site and on nearby tracts where harmful contaminants were released into soil, surface water, and groundwater. If not properly remediated under state and federal regulatory requirements by qualified environmental consultants/contractors, historical contamination liabilities may be inherited through chain of title even if the contamination originated offsite, particularly with migration through groundwater transport. The historical environmental event implication for site development depends on many factors including the type, extent, concentration, complexity, physical setting and surface/subsurface conditions, and time since the event, which may or may not pose a risk to prospective investors on site development.

A cursory review of the subject site and surrounding properties was conducted to identify any potential legacy environmental concerns. Informational resources consulted for this review include:

- EDR Radius Report;

- Recent and historical aerial imagery review;
- US Environmental Protection Agency's (EPA) Enforcement and Compliance History Online (ECHO) database (EDR Radius Report limits ECHO database search to the target property); and
- Information provided through interviews with local political officials, economic development representatives, and landowners (where available)

The EDR Radius Report searches environmental databases for permitted facilities, events, and other potential concerns occurring on the subject site and up to 1.0 mile of the site boundary. EDR use statement: "*A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate*".

Based on the results of the EDR Radius Report and a cursory review of historical aerial imagery, two environmental legacy concerns were identified near the subject site. One "site" appearing in multiple databases was identified within 0.25 miles of the subject site in the EDR Mapped Sites Summary:

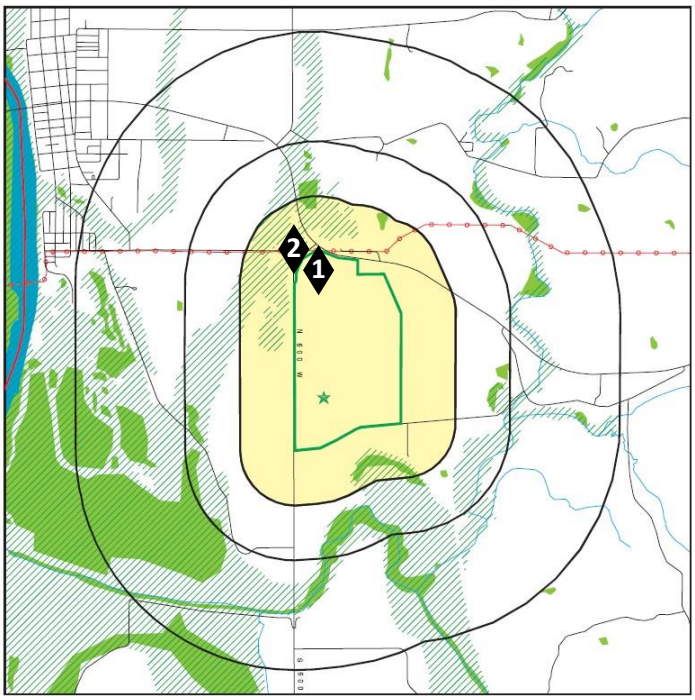

- ***USGS Mineral Resource Data System (MRDS)***
  - *Site Name: W. C. Hargis Pit*
  - *Distance: within 200 feet*
  - *Elevation: lower (522' MSL)*
  - *Map ID* **1** *(overview map below)*

- ***MSHA Mine Data Retrieval System***
  - *Site Name: Parke County Aggregates LLC*
  - *Distance: within 200 feet*
  - *Elevation: lower (515' MSL)*
  - *Map ID* **2**

The "sites" referred to as W.C. Hargis Pit (Map ID #1) and Parke County Aggregates LLC (Map ID #2) both represent the same facility, Parke County Aggregates, a sand and gravel mine located just west of the subject site across CR 600 W. It appears that the facility was originally called W.C. Hargis Pit and renamed to Parke County Aggregates LLC. The facility appears in multiple databases, including USGS Mineral Resource Data System (MRDS) and Mine Safety and Health Administration (MSHA) Mine Data Retrieval System.

A sand and gravel pit is a type of open pit mine used for the extraction of sand and gravel (aggregate) from a deposit near the surface of the earth. Site operators must consider a wide variety of factors when operating a gravel pit, including on-site dust management. Potential environmental issues from sand and

gravel pits are surface water runoff and groundwater migration that could impair water quality. Degraded air quality from stack emissions and disturbed areas on the mine is another potential issue.

EDR Radius Report Mapped Sites Overview Map

According to the MSHA Mine Data Retrieval System, the facility has had multiple 104(a) citations over the last two years. The violations are considered "significant and substantial" (S&S), meaning that the violation is reasonably likely to result in a serious injury or illness. Since specifics on the violations are not reported, it is assumed that the issues are likely related to workplace safety or health, rather than to environmental contamination. Based on the surface topography, it may be inferred that the groundwater flow is southwesterly from the gravel pit and away from the subject site. However, the extent of potential contamination resulting from the cited facility may not be fully understood without conduction of more extensive environmental site investigations by a qualified consultant. Full facility information is provided in the EDR Radius Report and is provided as **Appendix H**.

As the EDR Radius report limits environmental database searches to the subject site and within 1.0 mile of the subject site, the EPA ECHO database was consulted for potential significant environmental concerns within 2.0 miles of the site including active permitted facilities operating under the EPA Clean Water Act, Title V of the Clean Air Act, or the Resource Conservation and Recovery Act (RCRA) for control of solid waste. In limited instances, new air permit applications can be subject to more stringent requirements based on nearby existing permitted facilities' total air emission pollutant volumes and concentrations.

Based on the expanded ECHO search, no environmental legacy concerns were identified on the subject site.

ECHO Search results reported one facility with a regulatory compliance violation of the Clean Water Act within the past three years. The facility is called Superior Forest Product LLC and is located approximately half a mile to the west of the subject site. The violation is listed as "Late or missing discharge monitoring report (DMR) measurements". It occurred in the 2020 4th quarter and was resolved in the 2021 1st quarter. This is a very minor issue and should have no consequence to the subject site. Based on the expanded ECHO search, no environmental legacy concerns were identified on the subject site. The ECHO site search results are provided in **Appendix H**.

As with any desktop research exercise, actual potential environmental concerns may not be fully recognized or understood without conducting an on-site field investigation. The industry standard for

real estate environmental review is the Phase I Environmental Site Assessment (ESA). Governed by the ASTM E1527: *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* The Phase I ESA is designed to investigate property prior to ownership transfer or improvements for use to identify and document any existing or potential contamination that must be addressed or give cause for liability. The Phase I ESA methodology includes more detailed research and review of environmental databases, historical aerial imagery, title research, and on-site field observations of the subject site and immediately surrounding properties.

Connection

Site connectivity includes access to key transportation assets and utility infrastructure sufficient for the use intensity of the subject site. Access to available workforce is also measured within the context of the intended economic development project use (e.g., heavy industrial, light industrial, commercial/freight logistics, etc.). *The Montezuma Industrial Site is well connected to transportation and utility assets. In conjunction with strong community support, the site is well positioned for competitive response to industrial and agribusiness project opportunities*.

Transportation Assets are in place to serve the logistical needs of commercial/industrial business operations in the area. *Substantial transportation connections to the site include two-lane U.S. highway frontage and direct access and proximity to a multilane divided state highway.*

Access to the site is currently available via U.S. Highway 36 (US-36), a two-lane principal arterial highway adjacent to the site's northern boundary. The site is also bordered by County Road 600 W to the west, and W County Road 40 N to the south. A single point of ingress/egress is located along US-36. From the site, truck traffic must travel approximately 3.5 miles west on US-36 to access Indiana State Road 63 (SR-63), a four-lane principal arterial highway. Traffic must then travel approximately 25.0 miles north to reach Interstate 74 (I-74), or 26.4 miles south toward Terre Haute to reach Interstate 70 (I-70). Truck traffic can travel due east via US-36 toward Indianapolis for access to Interstates 70, 74, 65, and 69. While all roadways leading to interstate access appear to be in good condition and suitable for truck traffic, the distance from the site is considered a challenge for certain industry types. Site access map is included in **Appendix A**.

Truck Routes accessible by the site include US-36 for immediate east-west travel and SR-63 located approximately 3.5 miles to the west for north-south travel. I-74 access is located 28 miles north of the site, while I-70 access is 29 miles south of the site. Both serve as possible routes for east-west travel. US-36 can be taken east for 64.4 miles to reach Indianapolis and multiple other truck routes including I-65, I-69, I-70, US-421, and US-31. SR-63 can also be taken to either I-74 or I-70 before traveling west to Indianapolis. Another option is to travel 161 miles north via SR-63 and US-41 towards Chicago and the following truck routes: I-55, I-57, I-80, I-90, and I-94. SR-63

and I-70 can be taken southwest to St. Louis with access to I-44, I-55, and I-64. While the site is within reach of several truck routes, being at least 28.0-miles from interstate access is considered a challenge. A transportation vicinity map is provided in **Appendix A**.

Railroad lines do not currently extend to the subject site and are not required for the intended light industrial/manufacturing project uses of the site. The nearest railroad is a CSXT Railroad line approximately 1.8 miles in direct linear measure west of the site across the Wabash River. There is also a CSXT Railroad line in Parke County approximately 8.8 miles southwest of the subject site; this line would not have to cross the Wabash River. It is not considered economically feasible to pull a rail spur into the site. A transportation vicinity map is provided in **Appendix A**.

Airport access is beneficial for both corporate executives and other business-related representatives to travel to a facility during construction and when operational. Cargo airport access provides an opportunity for transportation of process input materials and product distribution.

The Terre Haute Regional Airport, Hulman Field (HUF) is a civil-military public airport located approximately 26.6 miles south of the subject site (~38-minute drive). It is a transport category airport capable of landing the world's largest aircraft. The airport covers 1,475 acres and has two runways measuring 9,020 feet and 7,200 feet in length. HUF features on-site hangars for rental and additional business-ready property, has a continued military presence with the location of the National Guard's 181st Intelligence Wing, and is home to Indiana State University's Flight Academy and Unmanned Systems program.

The Indianapolis International Airport (IND) is approximately 62.0 miles east (~1-hour and 17-minute drive) of the subject site providing passenger service. IND is home to the second largest FedEx Express hub in the world and was ranked as the sixth busiest U.S. airport in terms of air cargo throughput in 2020.

The Purdue University Airport (LAF) is within 66.8 miles northeast of the subject site (~1-hour and 16-minute drive). LAF is a regional general aviation facility operating two runways at lengths of 6,600 and 4,220 feet. For the 12-month period ending December 31, 2019, the airport had 117,727 aircraft operations, an average of 322 per day: 99% general aviation, 1% air taxi, <1% military/commercial. The airport has commercial charter, corporate and cargo flights to support the aviation needs. LAF is one of the busiest airports in Indiana, second only to Indianapolis International Airport.

Several county airports also serve the area.

Seaport access is not required for the intended light industrial and general agribusiness project uses of the site. However, the nearest seaport is Burns Harbor located within approximately 150 miles (~2.5-hour drive) north of the site. Burns Harbor is a port focused on steel, agriculture, and manufacturing located on Lake Michigan in the heart of the steel industry. Mount Vernon is another option that is approximately 155 miles away (~3-hour drive) south of the site. Mount

Vernon handles more cargo than any other port in the state. With close proximity to the confluence of the Ohio and Mississippi rivers, it serves as a major gateway for agricultural, energy, and manufacturing industries.

Utility Infrastructure is adequate for the subject site, though multiple extensions are needed. The Town of Montezuma provides water service and sewer lines, CenterPoint provides natural gas, WVPA provides electric service, and AT&T provides internet access. Water, sewer, and natural gas all need to be extended to the site. The utility service points of access for extending services to the site are located along the site's northwestern boundary. Site utility information obtained from the "Local Site Survey Questionnaire" is provided as **Appendix J**. Additional utility information obtained from the Parke County Economic Development Plan can be found in **Appendix D**. An energy infrastructure and utility access point map is provided as **Appendix A**.

Potable Water is provided by an 8" water main from the Town of Montezuma that runs along Main St/County Rd 100 N approximately 0.5 miles west of the site. The line would need to be extended further east toward the site to provide municipal water service. Current and proposed water service flow/capacities are indeterminate and should be verified on a project-by-project basis with local water utility officials. Information provided by Parke County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Sewer/Wastewater extends east from the Town of Montezuma along Main St/County Rd 100 N towards the site. The system would need to be extended approximately 2,450 feet to service the subject site. A 20 gpm lift station is located near the end of the current service line, on the east side of Superior Hardwoods. The lift station conveys flows directly to the wastewater treatment plant via a 2-inch diameter force main. A 4-inch force main was also installed to allow for future growth and for the use of larger pumps.

According to the Parke County Economic Development Plan, Montezuma operates a vacuum sewer collection system; this makes connecting to existing sewer lines not as easy as traditional gravity sewer systems. Vacuum sewers have a limited capacity in each line, and a buffer tank is required ahead of the line if there is not sufficient capacity. Montezuma's wastewater treatment system has an average capacity of 75,000 gpd and a peak capacity of 213,540 gpd. Average flows are currently 49,500 gpd with peak flows at 94,000 gpd. There is additional capacity available at the plant to serve industrial flows. The current system capacity is described as follows: The sanitary sewer lift station has an unallocated capacity of approximately 10 gpm. The wastewater treatment plant can accommodate up to 18,000 gpd additional flow before reaching 90 percent of its average flow. The lift station is approximately 20.5 feet deep. This depth will allow it to serve most sites within 0.25 to 0.5 miles from the lift station.

The Parke County Economic Development Plan makes the following observations and recommendations: Because of the limited capacity, economic development efforts should focus on low volume water users (primarily oriented to flushing toilets) and avoid industry with industrial/process water use. Pumping capacity at the lift station can be increased by changing

out the pumps and using the 4-inch force main. The lift station can serve a larger area by installing a grinder pump station at the development and pumping to the lift station.

Information provided by Parke County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Natural Gas is available approximately 0.6 miles from the subject site in the Town of Montezuma. Natural gas service would be provided by CenterPoint Energy if extended to the site. The exact current and proposed natural gas locations and capacities are indeterminate and should be verified on a project-by-project basis with Parke County officials. Information provided by Parke County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Electric power is provided by WVPA with 3-Phase electric distribution serving the site. The nearest substation identified by Parke County officials is located approximately 8.0 miles from the site in the Town of Rockville. Exact locations of electric distribution lines and total available capacities are indeterminate and should be verified on a project-by-project basis with Parke County officials. Information provided by Parke County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Telco/Broadband distribution is provided to the site by AT&T. AT&T currently provides DSL internet connection and, according to county officials, may be able to provide copper-based internet as well. Fiberoptic internet infrastructure provided by Bloomingdale Home Telephone is located approximately 2.0 miles east of the subject site. Information provided by Parke County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Major Market Areas are accessible within a two-hour drive of the subject site. By vehicular travel, the site is situated 64.3 miles from Indianapolis to the east and 161 miles from Chicago to the north with 2021 total populations of 882,039 and 2,696,555, respectively. Travel distances to major markets and seaports are provided below. A major market vicinity map is provided as **Appendix A.**

Time and Distance to Ports

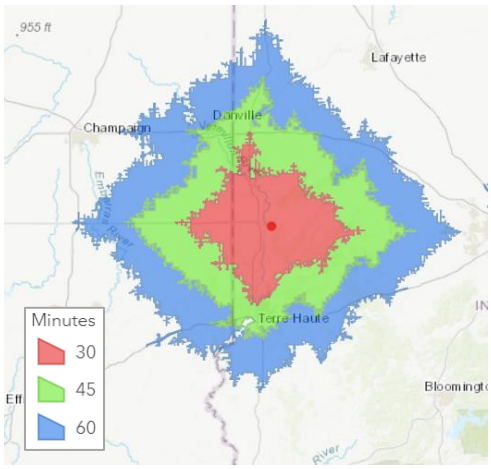

Ports of Indiana	Travel Time	Miles
Burns Harbor	2:39	155
Mount Vernon	2:56	160
Jeffersonville	3:07	177

Time and Distance to Major Markets

Major Markets	Travel Time	Miles
Indianapolis, IN	1:27	64.3
Chicago, IL	2:48	161
Cincinnati, OH	3:09	177
Louisville, KY	3:11	180
St. Louis, MO	3:09	193
Fort Wayne, IN	3:23	199
Columbus, OH	4:11	247
Lexington, KY	4:21	254
Milwaukee, WI	4:16	255
Nashville, TN	4:53	285
Toledo, OH	4:51	301
Detroit, MI	5:47	361
Cleveland, OH	6:19	388

Community

Community aspects conducive to site competitiveness include both measurable and intangible factors that can either strengthen or undermine a site's inherent competitive advantages. While workforce availability and cultural features are commonly accounted for, business and political climate are often neglected, yet serve as an important indicator for both community and governmental desire to welcome new business investment. The Parke County community and political leadership are strong proponents of business growth and new job creation, creating a business climate highly conducive to project investment support through efficient permitting, workforce training, and competitive tax structures. Parke County is committed to supporting long-term industrial and commercial business operations in its communities.

30, 45, 60-minute Drive-time Employment Query

Description of the Economy

Parke County is located in Indiana, a state that boasts a business-friendly environment, solid infrastructure, and substantial creation of manufacturing jobs. The county falls within the West region of Indiana and has a population of 16,407 (US Census Bureau). Rockville, the county seat, has a population of 2,469 (US Census Bureau). Parke County is primarily a rural county with extensive agriculture, and the economy is supported by small town communities and a government favorable of business expansion and development. Further information about Parke County population and economic trends can be found in the 2019 Economic Development Plan, provided as **Appendix D.**

Demographics

Parke County has a population density of approximately 39 persons per square mile (ppsm), compared to the state population density of 181 ppsm, and is the seventy-eighth most populated county in the State of Indiana. The population, considering race alone or in combination with one or more other races, is roughly 98.0% White, 1.7% Black or African American, 1.9% Native American, 0.2% Asian, 0.1% Pacific Islander, and 0.9% some other race. Approximately 1.6% of the population are Hispanic or Latino. The county's median age is 43.2.

Employment and the Economy and Income

Parke County, IN is home to a total resident labor force of approximately 7,046 people. A majority of Parke County's workforce (73.5%) commutes out of Parke County. Unemployment (6.0%) is higher than the state average (4.8%). Manufacturing; Educational Services, Health Care & Social Assistance; and Retail Trade make up the largest industries in the county, employing 24.9%, 16.4%, and 10.2% of workers, respectively. The Manufacturing sector employs 1,652 people; Educational Services, Health Care & Social Assistance employs 1,083 people; and Retail Trade employs 678 people. The highest paying industries in Parke

County, by median earnings, are Professional, Scientific, & Technical Services; Utilities; and Finance & Insurance, with 2020 median annual earnings of $57,321, $56,023, and $55,474, respectively. Median household income is $52,618, which is less than the median annual income of $62,843 across the United States.

Population/Workforce *within a 60-minute drive time from the site include a total population of more than 357,762 and 12,823-plus businesses employing over 165,651 people according to Esri 2022 demographic data. Construction, manufacturing, and professional, scientific, & technical services account for 16.3% of businesses employing 27.1% of total workforce within the 60-minute driving radius of the site*. A 30, 45, and 60-minute drive-time query of employment numbers for construction and manufacturing jobs (by NAICS Code) was performed for the subject site. The following employment numbers were reported:

30, 45, 60-minute Drive-time Employment Count*

Business Type by NAICS Codes	Employees		
	30-min	45-min	60-min
Construction	1,332	5,747	10,941
Manufacturing	3,630	17,120	30,395
Professional, Scientific & Tech Services	462	2,503	4,804
Totals	**5,424**	**25,370**	**46,140**

**Source: Copyright 2022 Infogroup, Inc. All rights reserved. Esri Total Residential Population forecasts for 2022.*

Parke County target industries include light industrial, agribusiness, tech, and business park. With access to a total workforce of over 170,209 which includes 46,140-plus employed in construction, manufacturing, and professional, scientific, and technical services sectors, workforce availability to meet project labor demands of county industry targets is low and presents a challenge to project development potential for industries requiring a high labor force count. Population and business summary reports are provided in **Appendix I**.

Cultural Features within three miles of the subject site that may pose community risk or public opposition to industrial development are limited and generally do not affect site permitting, construction, or facility operation. Fire and police protection and emergency medical services are within relatively close distance to the subject site, but not close enough to pose cross-transportation risks for site construction or facility operation. A cultural features map is provided in **Appendix A**.

Schools are not located near the subject site and are concentrated further to the east in the Town of Rockville. There is a single elementary school in the Town of Montezuma called Montezuma Elementary School. It is approximately 1.2 miles northwest of the subject site. With the site over a mile away and truck traffic having access to a US highway, the school should not pose any issues to site development.

Churches are sparsely spread throughout a 3-mile radius of the subject site. There are 5 total churches within three miles of the subject site's buildable area. Three of the churches are in the Town of Montezuma, one is to the west in Vermillion County, and the other is 3 miles east of the site in a residential/rural area. The site poses no significant operational proximity or transportation risks to these churches.

Cemeteries do not exist immediately proximate to the site or along principal site access routes. The Armiesburg Cemetery is located 0.2 miles southwest of the site's buildable area, across CR 600 W. The cemetery is very small and is not located adjacent to the road. As such, this poses no risk to site permitting or operation

Group Care Centers including nursing homes, assisted living centers, special education schools, crisis units, and hospice facilities do not exist immediately proximate to the site or along principal site access routes. There are no assisted living facilities located within 3 miles of the subject site. The nearest facility is a nursing and rehabilitation center located in the Town of Rockville, approximately 7 miles to the east of the subject site.

Other Cultural Centers including libraries, museums and art galleries, movie theaters and performing arts centers, zoos and aquariums, arboreta and botanical gardens, and planetariums do not exist immediately proximate to the site. The Montezuma Public Library is in the Town of Montezuma and should pose no threat to industrial development.

Parks and Protected Lands do not exist immediately proximate to the site or along principal site access routes. The Montezuma B&O Walking Bridge and Reeder Park are both located approximately 1.2 miles west of the site in the Town of Montezuma near the Wabash River. This area is sufficiently removed from the operational footprint of the site (e.g., buildable area). Site ingress/egress road access does not intersect or share park access. A protected lands map is provided in **Appendix A**.

Correctional Facilities including federal, state, and local prisons and detention centers do not exist immediately proximate to the site or along principal site access routes. The Rockville Correctional Facility is in the Town of Rockville approximately 8.4 miles from the site.

Fire Protection/EMS is provided by the Montezuma Reserve Township Volunteer Fire Department located within 1.4 miles driving distance of the site access point. The response route is approximately 2-minutes, with trucks taking E Crawford Road/US-36 directly to the site. The Rockville Fire Department is another further option located 11-minutes and 7.3 miles to the east of the site in the Town of Rockville. The response route is from N Virginia St to W Ohio St/US-36 and directly to the site. Fire and EMS response time and capacity should be locally verified.

Law Enforcement is provided by the Montezuma Police Department. There is conflicting information on where the police department is located, with one data point showing the location in the Town of Montezuma, and another showing it in the Town of Rockville. An analysis of Google Street View shows the Montezuma Town Marshall to be located adjacent to the Montezuma

Public Library. Since there are no patrol cars outside of the building, it is assumed that the location of the police department is located in the Town of Rockville, approximately 7.0 miles east of the site. The response route is N Jefferson St to W Ohio St/US-36 and directly to the site. The Parke County sheriff is located adjacent to the Rockville Correctional Facility. It is an 11-minute and 7.6-mile drive to the site access point. Law enforcement response time and capacity should be locally verified.

Hospital/Emergency Care is not provided within 3-miles of the subject site. Medical emergencies will have to travel 10.4 miles (~15-minute drive time) southwest to the Union Hospital in the City of Clinton in Vermillion County. This is a critical access facility with 25 staffed hospital beds. For minor emergencies, the Valley Professionals Community Health Center is a closer option in the Town of Rockville approximately 7.1 miles and a 10-minute drive away. For larger hospitals, emergencies will have to travel to the City of Terre Haute to either Union Hospital (22.5 miles and ~30-minute drive time) or Terre Haute Regional Hospital (27.2 miles and ~40-minute drive time). Union Hospital of Terre Haute is a short acute care hospital with 259 total staffed beds. Terre Haute Regional Hospital is also a short acute care hospital and has 195 total staffed beds.

Historical Preservation records include locations of cultural or archaeological significance, some of which are formally designated as state and/or federally protected historical resources under State Historic Preservation Offices (SHPO) and/or National Register of Historic Places registrations. Historical resources, if located on the subject site, may alter, impede, or preclude development if potential for disturbance or encroachment exists. Historical resources located near the subject site may warrant mitigating site planning and design elements such as line-of-site buffering between facilities and a historically significant structure. The Indiana Department of Natural Resources (IDNR) houses the Division of Historic Preservation and Archaeology (DHPA), which promotes the conservation of Indiana's cultural resources. The DHPA facilitates state and federal preservation programs and is the staff of the State Historic Preservation Office. The DHPA's Archaeology Team administers programs for protecting and preserving Indiana's prehistoric and historic archaeological sites, is the central repository of archaeological records and reports, and houses the state's official computerized database of archaeological site information.

Several cultural resource GIS datasets from the IDNR were consulted for potential location of culturally or historically significant resources on or near the subject site. These datasets are collected and contained within the State Historic Architectural and Archaeological Research Database (SHAARD), which allows users to search cultural resource information on known historic and archaeological resources throughout the State of Indiana. SHAARD includes data from the Indiana Historic Sites and Structures Inventory county survey (IHSSI), the Indiana Cemetery and Burial Ground Registry, historic bridges and canals, historic theaters, and properties listed in the National Register of Historic Places and the Indiana Register of Historic Sites and Structures. The data contained in SHAARD was collected from previously conducted cultural resource inventories, National Register nominations, and cultural resource management projects. SHAARD and associated resource maps are ongoing initiatives and are updated daily, so the absence of data does not necessarily indicate the absence of resources. A more formal archaeological survey may be necessary prior to site development.

A desktop data review was conducted regarding available records for potential cultural resources present on the subject property. *The SHAARD database identified no archaeological sites and no historic structures on the subject site. Seven historic structures were identified within a 1-mile radius of the subject site, including two historic houses, a historical marker, a cemetery, and three historic bridges. The reported structures (Survey Numbers 121-395-45007, 121-423-15013, 121-423-45008, 121-423-45009, 121-423-45010, 121-423-45011, and HB-3081) are shown on the corresponding SHAARD web application map. Of the structures shown, three (one historic house and two historic bridges) are listed as "Outstanding", while the remainder are marked as "Contributing". "Outstanding" means that they contribute to the historic character of the district, were built during a period of significance, and retain their appearance from that time. Two historic structures, Skeeter's House (Survey Number 121-423-45008, Outstanding) and the Christmas (Noel) Degenet Historical Marker (Survey Number 121-423-45009, Contributing), are located adjacent to the site's southwestern corner across County Road 600 W. Just west of these is the Armiesburg Cemetery (Survey Number 121-423-45010, Contributing). These three historic structures are in closest proximity to the subject site. Since the specified structures are located across the street and should not be affected by onsite construction, they do not present significant impediments to the development of the subject site. All other historically significant resources are located outside the 1-mile buffer surrounding the subject site boundary and are not likely to impact site development potential.* The SHAARD/IHSSI Reports for both structures are provided as **Appendix K**, and the Historic Resource search map is provided as **Appendix A**.

SHAARD Map Search

As with any desktop research exercise, actual potential historic preservation concerns may not be fully recognized or understood without conducting an on-site field investigation. The industry standard for real estate environmental review is the Phase I Cultural Resources Survey. The primary objective of a Phase I archaeological survey is to identify and record all cultural resources within a project area. Cultural resources can include prehistoric Native American habitation sites, historic farmstead sites, standing structures, or other man-made features such as earthworks, old roadbeds, or cemeteries. The Phase I survey process typically begins with Phase IA Archaeological Reconnaissance to conduct historical research, environmental context review, and field inspection. When an archaeological site is encountered, a full written report must be submitted following guidance provided in the Current Guidebook for Indiana Historic Sites and Structures Inventory—Archaeological Sites and the Indiana Cultural Resources Manual.

Indiana Code 14-21-1 provides protection for archaeological sites and historic burial sites regardless of their location on state or private lands. All archaeological sites with artifacts dating before December 31, 1870 are protected under this act. Human burial sites are afforded protection under IC 14-21-1, IC 14-21-2, IC 23-14 (Indiana General Cemetery Act). The State of Indiana implements specialized reviews that provide protection to historic properties on state-owned or leased land or to historic properties that are

listed in the National Register of Historic Places or the Indiana Register of Historic Sites and Structures and that will be altered, demolished, or removed using state funds. These review processes are established in Sections 14, 16, and 18 of Indiana Code 14-21-1. In addition, projects that will disturb the ground within 100 feet of a cemetery or burial ground for the purpose of excavating or covering the ground or erecting, altering, or repairing any structure are reviewed in Sections 26-26.5. In order to increase the confidence in understanding any potential historical preservation concerns for the subject site, it is recommended that a Phase I archaeological survey be conducted by a qualified cultural resource management/archaeological consulting professional and that archaeology state laws listed in Title 14, Article 21 of the Indiana Code are thoroughly understood. Relevant sections of the Indiana Code are provided as **Appendix K.** Information regarding Indiana Archaeology Law, complete with links to the full Indiana Code and Indiana Administrative Code, is also provided as **Appendix K.**

Education and Technical Training Assets surrounding the subject site are considered as a challenge for serving the professional and technical workforce needs of Parke County target industries and recruiting opportunities to local businesses. Access to workforce training near the Montezuma Industrial Site is considered a significant challenge. Although local workforce shortcomings may be offset by the site's proximity to the Indianapolis workforce within a 1.5-hour drive and Terre Haute workforce within as 45-minute drive, current countywide workforce availability and development/reskilling initiatives lack the scale to meet the demands of the labor market. Parke County is currently working to enhance its understanding of necessary local post-secondary training improvements to better serve its business and workforce education needs. Statewide initiatives are also available for assisting businesses and their workforce development requirements.

The Indiana Department of Workforce Development (DWD) offers a variety of services to statewide job seekers looking to enter the workforce, return to the workforce, or locate education and training opportunities. These include Hoosier Talent Network, INDemand Jobs, Indiana Career Explorer, Indiana Career Connect, Cyberseek Indiana, and Indiana Career Ready. The DWD offers several services including job search help, hiring events, training grants, specialized training and more: https://www.in.gov/dwd/.

Indiana's WorkOne Career Centers are the heart of the workforce development system, providing assistance in understanding jobs in demand today, helping workers determine their interests and abilities, offering access to training opportunities, and providing information needed to succeed in today's economy. WorkOne's Job Opportunities and Business Services (JOBS) Program assists employers in locating and developing a skilled team by determining eligibility, recruiting employees, formulating WorkKeys job profiles, and providing skills assessments to identify gaps and training needs. WorkOne's WIN Career Readiness is a fundamental workplace skills training system available to Indiana residents, employers and training providers. Both the DWD's Work Opportunity Tax Credit (WOTC) and Federal

Bonding Program benefits employers by offering incentives for hiring jobseekers who may traditionally have difficulty finding employment.

Next Level Jobs provides free training for Indiana workers and reimbursements for Indiana employers for training employees in high-demand fields. Next Level Jobs assists job seekers by providing Indiana residents with free training in high-growth job fields and the opportunity for them to earn a high-value certificate in one of Indiana's in-demand job fields, tuition free. Next Level Jobs assists employers with reimbursements for training their employees through the Employer Training Grant, which will reimburse an employer for up to $5,000 per trained employee who is trained, hired, and retained for six months, granting up to $50,000 per employer.

Ivy Tech Community College is a two-year vocational/technical college with locations surrounding the site within an hour drive in the cities of Terre Haute, Greencastle, and Crawfordsville. The closest campus is approximately 31 miles from the subject site. Ivy Tech specializes in developing programs geared towards specific skills needed for existing manufacturers and other industries.

Other higher education centers within 45 miles of the subject site include Indiana State University, the Rose-Hulman Institute of Technology, and Saint Mary-of-the-Woods College in Terre Haute, Indiana; DePauw University in Greencastle, Indiana; and Danville Area Community College in Danville, Illinois.

The site is within reach of several colleges and trade schools in the Indianapolis area including Indiana University–Purdue University Indianapolis, Butler University, Marian University, University of Indianapolis, Martin University, and Lincoln College of Technology. These institutions are all located within an hour and forty-five-minute drive time of the subject site.

Wabash River Career & Technical Education also provides educational services to high schools in Parke County.

Business Climate is highly favorable for bringing in quality job-creating businesses to the area. Indiana is considered one of the best states in the nation for long-term fiscal stability and low corporate income tax rates, creating a business-forward environment throughout the state. The State of Indiana's target Industries according to the IEDC include advanced manufacturing, aerospace and aviation, ag-bioscience, defense, life sciences, logistics and transportation, and technology. These industries can take advantage of existing transportation assets throughout the state and county to serve an array of unique business logistical needs. The following target industries are listed by Parke County officials: light industrial, agribusiness, tech, and business park.

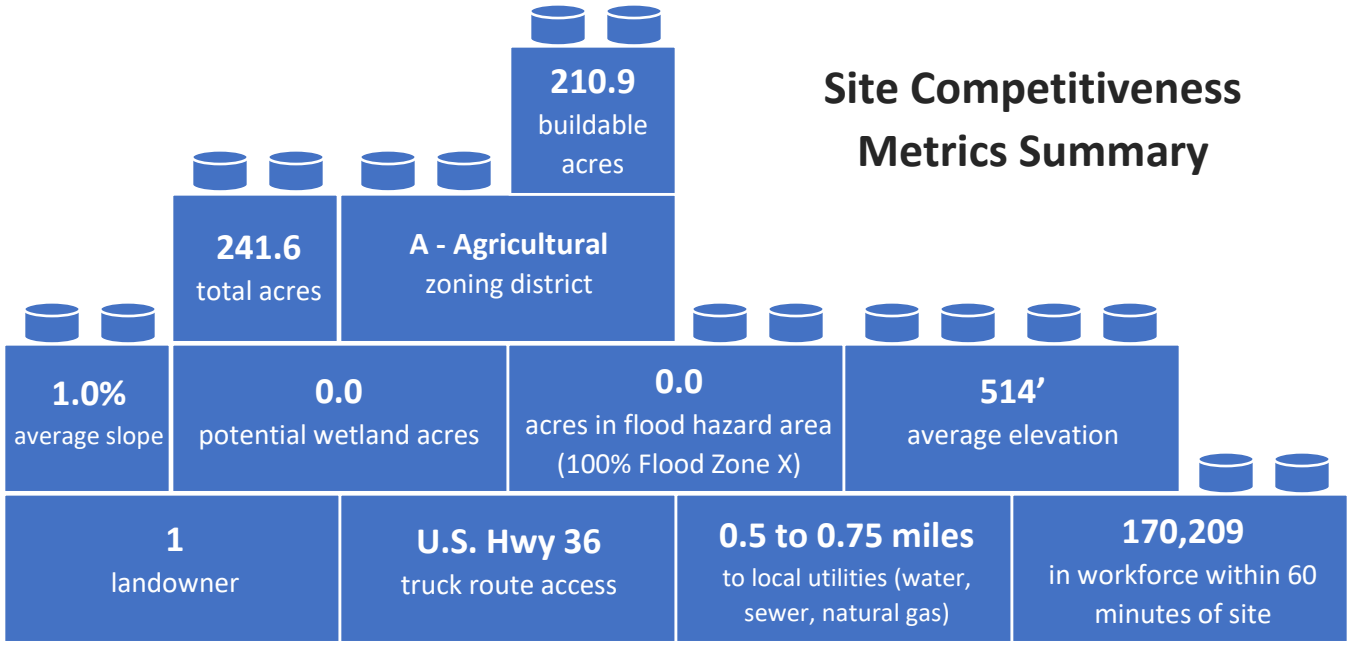

Parke County has a labor force of 7,046 and an unemployment rate of 6.0%. Business development and assistance is provided locally by Partnership Parke County. Local incentives include tax abatements to new and expanding businesses and the Revolving Loan Fund. Both personal and real property abatements are available through Parke County and its incorporated towns. To be eligible for industrial/commercial tax abatement, a project must be located within a designated Economic Revitalization Area (ERA), while tax abatement with a TIF District requires consideration by the Redevelopment Commission. Requests are considered on a case-by-case basis and may be granted for one to ten years. The subject property's

location is in the West Central TIF District and State incentives are available. Parke County's Revolving Loan Fund is operated and approved by the Parke County Redevelopment Commission (PCRC).

In addition, the IEDC provides for a variety of programs and initiatives offering business support and expertise to companies that are investing and creating jobs in Indiana. These include the Indiana Regional Cities Initiative, Certified Technology Park program, Broadband Ready Communities program, and Next Level Roads program.

The State of Indiana offers a variety of incentives for all types of businesses, including targeted industries, workforce training, infrastructure, and special opportunity incentives. Indiana's business tax structure is competitive—the corporate income tax is decreasing to 4.9%, and the state offers many business tax incentives, corporate tax credits and economic development programs. Statewide incentives include the Community Revitalization Enhancement District (CRED) Tax Credit, Data Center Gross Retail and Use Tax Exemption, Economic Development for a Growing Economy (EDGE) Tax Credit, Industrial Grant Fund (IDGF), Tax Exemption for Patent-derived Income, Skills Enhancement Fund (SEF), Venture Capital Investment Tax Credit program, Hoosier Business Investment (HBI) Tax Credit, Research Expense Credits, Research and Development Sales Tax Exemption, and Redevelopment Tax Credit (RTC).

Political Climate is strong according to interviews with local officials, and the community is largely in favor of commercial/industrial business development to bring long-term economic growth to the area.

Subject Site Key Facts

Advantages	Disadvantages
A large buildable area of just over 200 contiguous acres (210.9 acres) is available	Parke County economic development officials have not confirmed that the Landowner is actively promoting the site for sale
The site has low flood risk, no recorded or observed hydrography features, and minimal wetlands	While all roadways leading to interstate access appear to be in good condition and suitable for truck traffic, the 28.0-mile distance from the site is considered a challenge for certain industry types.
Parke County community and political leadership are strong proponents of business growth and new job creation creating a business climate highly conductive to project investment	Tracts surrounding the subject site, and especially the buildable area, should be considered for rezoning with uses that are compatible with the intended industrial uses of the site. Compatibility with surrounding land use is vital to preserving the competitiveness of the site for an economic development use by preventing encroachment of land uses that would create real or perceived risk to prospective business considering the site for development.
The surrounding land use is ideal to support the development of industrial and agribusiness project land uses.	
The majority of the buildable area has soils that are very favorable for an industrial project land use. Good performance and very low maintenance can be expected.	There is limited capacity for both sewer/wastewater and potable water. This limits economic development efforts to low volume water users. The lines also have to be extended into the site.

Site Competitiveness Report Card

The Site Competitiveness Report Card is an indicator of favorable development conditions across customary competitiveness factors. A relative score for each factor is given as a letter grade, akin to a 4.0 education grade point average (GPA). The GPA is calculated for each competitiveness area: Condition, Connection, and Community with an overall site GPA derived as a relative indicator of site competitiveness for an economic development land use.

Competitiveness Driver			
Condition		Comments	3.8

Rough Order-of-Magnitude Site Development Cost Summary

A rough order-of-magnitude (ROM) cost estimation for pre-construction site preparation and utility and transportation infrastructure improvements was calculated to provide a general understanding of potential site development costs. ROM cost tables for the buildable area are presented below.

Notes:

- *Does not include costs for engineering, permitting, or general project management.*
- *This cost estimate was prepared with the best information available at the time of analysis.*
- *Actual costs can vary based on availability of material, site conditions, and labor.*
- *ROM costs generated from GIS data and use of RSMeans construction cost estimating software.*

ROM Costs for 18121-004 Buildable Area (210.9 acres)

Project: 18121-004
Location: Parke County, IN

WORK ACTIVITY	QUANTITY	UNIT	UNIT COST	SUBTOTAL	TOTAL
ON-SITE PREPARATION					
Site Clearing					
Mobilization	1.00	EA	$80,000.00	$80,000.00	
Demolition (Structure)	0.00	EA	$25,000.00	$25,000.00	
Clearing	0.00	AC	$2,500.00	$0.00	
Topsoil Strip/Cut	154880.00	CY	$2.31	$357,772.80	
Total Site Clearing				$462,772.80	$462,772.80
Grading Cut					
Earth Cut	330000.00	CY	$3.00	$990,000.00	
Total Grading Cut				$990,000.00	$990,000.00
Grading Fill					
Earth Fill	330000.00	CY	$3.00	$990,000.00	
Total Grading Fill				$990,000.00	$990,000.00
Other Preparation					
Fine Grading (Building)	0.00	SY	$1.45	$0.00	
Fine Grading (Non-Building)	0.00	SY	$0.95	$0.00	
Erosion Control	100.00	AC	$2,500.00	$250,000.00	
Seeding	220.00	AC	$1,250.00	$275,000.00	
Total Other Preparation				$525,000.00	$525,000.00
				TOTAL	**$2,967,772.80**
OFF-SITE IMPROVEMENTS					
Lift Station Upgrade	1.00	EA	$250,000.00	$250,000.00	
Total Utilities				$250,000.00	$250,000.00
Road Improvements					
Turning Lane Left (300')	1.00	EA	$196,086.42	$196,086.42	
Turning Lane Right (300')	1.00	EA	$189,320.60	$189,320.60	
Total Road Improvements				$385,407.02	$385,407.02
				TOTAL	**$635,407.02**

Total Utilities				$457,400.00	$457,400.00
				TOTAL	**$457,400.00**
				SUB-TOTAL	**$4,265,697.74**
			Construction Contingency	10% Contingency	$426,569.77
			Total Cost Estimate For Site Construction w/o Mitigation		**$4,692,267.52**
			Total Cost Estimate For Site Construction with Mitigation		**$4,692,267.52**
SOFT COSTS					
Engineering				5.00%	$234,613.38
Surveying & Staking				2.50%	$117,306.69
Testing & Inspecting				1.00%	$46,922.68
Construction Management				4.75%	$222,882.71
Studies					$100,000.00
				TOTAL	**$721,725.45**
				Total Cost Estimate For Site	**$5,413,992.96**

*****_ROM costs are intended to estimate the rough order of magnitude costs to bring the site to a project construction ready pad with utilities, entrances, off-site improvements, drainage, and grading. This does not include any project specifics regarding design, facilities, construction within the PAD, impact fees, regulatory requirements, entitlement costs, etc. These costs were based on information provided within the report and assume a ~210.9-acre PAD (excluding required open space, buffers, storm water management, and site access)._

Site Competitiveness Opinion

Overall, the Montezuma Industrial Site in Parke County is a competitive greenfield site that is a good prospect for industrial and agribusiness project opportunities.

The site has several competitive features that position it as a strategic real estate asset to support economic development. Firstly, the site is within proximity to all major utilities including electricity, natural gas, wastewater & sewer, potable water, and broadband/fiber. However, it should be noted that there are capacity limitations for wastewater & sewer and economic development efforts should be limited to low volume water users. Also, current and proposed water service flow/capacities for potable water are indeterminate and should be verified with local Parke County utility officials. Another strength for the site is that it contains a large contiguous PAD of just above 200 acres that is mostly flat and dry with favorable soils for large-scale industrial development; a review of the SSURGO soils database states that good performance and very low maintenance can be expected across the majority of the site. The property is also located in an area with surrounding land use that is ideal to support the development of industrial and agribusiness project land uses. The primary access road, U.S. Highway 36 (US-36), a two-lane principal arterial highway, is an adequate transportation route that connects the site to Indianapolis and multiple different interstates and truck routes. Finally, Parke County community and political leadership are strong proponents of business growth and new job creation creating a business climate highly conductive to project investment

Some challenges for the site also exist, including limited utility capacities, distance from direct interstate access, and lack of landowner engagement. Currently when leaving the site, truck traffic must travel a minimum of 28.0 miles to access the interstate. While all roadways leading to interstate access appear to be in good condition and suitable for truck traffic, the 28.0-mile distance is considered a challenge. It is recommended that a focus be placed on attracting industries that have a tolerance for being without direct interstate access. Having direct access to a U.S. Highway and multiple different routes to large metropolitan areas should be sufficient in attracting a variety of desired industry types. Another challenge for the site is the limited capacity for both sewer/wastewater and potable water. This limits economic development efforts to low volume water users, thus preventing certain industry types from locating on the property. Lastly, Parke County economic development officials have not yet confirmed that the landowner, Winterberg LLC, is actively promoting the site for sale. LL+D strongly recommends that Parke County pursue and secure a real estate purchase option agreement with the landowner. This is critically important to reduce uncertainty regarding property availability and price.

Upon considering the factors mentioned throughout the SSI Phase II Report, it is the opinion of LL+D that the Montezuma Industrial Site should be considered a nationally competitive site for attracting quality job-producing light industrial and general agribusiness projects to Parke County. With nearby access to all major utilities, a PAD of over 200 acres, direct frontage on a U.S. Highway, community support and political leadership from Parke County, the property should be considered a high-quality site that is prime for development.

Purpose and Use of Study

Sites originating from Phase I have demonstrated qualitative compliance with engineering. environmental, infrastructure, and cultural location criteria. That said, in order to develop an actionable understanding of true site competitiveness, a more detailed study of the subject site is required. SSI Phase II: Preliminary Due Diligence is designed for this purpose.

Purpose

The purpose of the SSI Phase II study is to provide an understanding of the subject site's advantages and challenges in conjunction with a ROM cost estimate to improve site functional use and mitigate development challenges. The SSI Phase II study is a desktop-based preliminary due diligence exercise performed by discipline-specific experts with experience in industrial and commercial property development. Study of the subject site's physical and surrounding characteristics, assets, and impediments for development are reviewed in sufficient detail to formulate a defendable opinion on the competitive value of the property for economic development.

Use

There are three primary intended uses of an SSI Phase II report: (1) site advancement decision support; (2) consideration for investment in site improvements; and (3) site marketing. Each intended use is discussed below.

Site Advancement Decision

The SSI Phase II study is designed to provide decision support for the advancement of sites to market though the landowner engagement process. SSI Phase II findings serve as an indicator for the likelihood the subject site will survive the intensive scrutiny of formal, field-based engineering and environmental due diligence. Detection of severe site deficiencies or encumbrances, often referred to as fatal flaws, during desktop preliminary due diligence can avoid expenditure of significant resources in subjecting sites with little chance of survival to formal due diligence. Short of fatal flaws, SSI Phase II may reveal less than ideal conditions or less severe yet concerning challenges that can marginalize site competitiveness or be detrimental to business attraction, respectively. The most important use of the SSI Phase II study is to ensure confidence in the decision to advance sites to market graduation through subsequent phases for landowner engagement and formal due diligence. *Ultimately, site advancement decisions should be tempered by local industry targets and the host community's real estate needs to support those targets.*

Site Improvement Investment Considerations

The findings of the Phase II study, along with an estimate of the ROM costs needed to make functional site and infrastructure improvements, provides concrete data for Economic Development Offices (EDOs) to consider while making investment decisions to improve site marketability. There may be strong business cases for increasing site competitiveness by making incremental investment in infrastructure

improvements or mitigation of development challenges. There are many conditions to be considered in investing significant dollars on speculative site improvements including market, economic, fiscal, real estate, and political factors. While the information provided through the SSI Phase II study should not be exclusively considered for site improvement expenditures, the findings may provide an initial quasi prospectus on site development expenditure and associated return-on-investment (ROI).

Site Marketing

The best greenfield site in America is of no consequence to the host community if industry prospects are unaware of its value and availability. Many EDOs invest in branding and marketing campaigns to showcase their community's differentiating attributes to attract business investment. If prematurely launched, many communities unfortunately become "the dog that caught the car". The well-qualified community successfully attracts the serious interest of a prospective company only to lose the project, and possibly credibility for future projects, because it fails to offer a competitive site.

It is the opinion of LL+D, based on extensive industrial and commercial site selection experience, that the methodology, objectivity, and level of detail and completeness provided in this report are sufficient to support the competitive claims of the subject site for its intended project land use(s). Accordingly, the information contained in this report can and should be used to supplement site marketing materials, specifically for RFI responses and proactive target industry solicitations. However, EDOs should exercise judicious use of SSI Phase II site information for the purposes of site marketing in advance of formal landowner engagement and security of real estate purchase opinion. The real estate purchase option is pursued during SSI Phase III: Landowner Engagement.

Warranty

All Phase II project tasks are intended to serve as an informed guide to determination of site advancement to the formal due diligence phase of inventory development. All information and opinions provided in this report are limited to planning-level engineering and environmental considerations and do not rise to the investigative level of study for site design uses.

All data used in this study originates from public domain sources. All findings derived from the use of public domain data are subject to potential errors and omissions inherent digital data sets which may include spatial and attribute accuracy, completeness, and currency. Data and other information cited in this study has not been verified for quality of accuracy. As such, the confidence in findings provided herein and corresponding opinions are subject to the limitations of the data and other information sources consulted in the conduct of this study.

Ultimate site development potential and fatal flaw analysis cannot be determined without physically visiting the site and conducting formal engineering and environmental due diligence. However, Leotta Location and Design is confident that our site screening methodology is highly effective in eliminating low quality or practically undevelopable sites and presents candidate sites with a high likelihood of confirming results through more formal engineering and environmental due diligence.
