SSI PROGRAM

INDIANA FOR THE BOLD

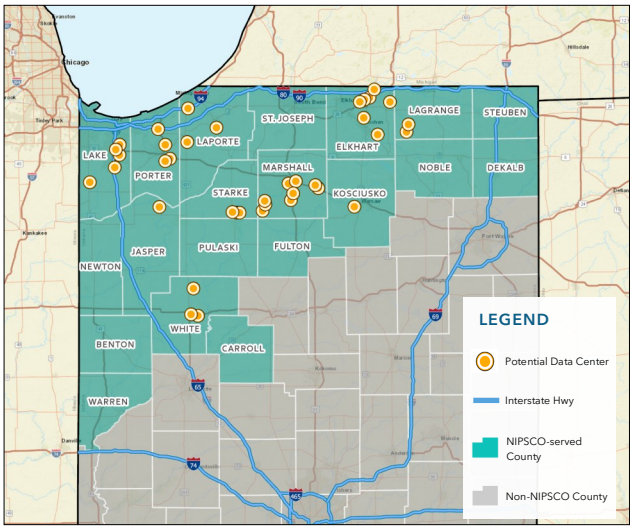

SSI: Data Center Phase I Summary

NIPSCO

PROJECT OVERVIEW

NIPSCO's **SSI: Data Center Phase I** project is a strategic initiative to uncover and prepare Indiana sites positioned for both conventional and hyperscale data center investment. The goal is to establish a robust statewide catalogue of large-scale facilities to meet growing cloud computing and storage demands, along with a pool of smaller enterprise or colocation sites, that will attract major investments from leading technology companies.

Indiana's strong fiber connectivity, abundant low-cost and renewable energy resources, central location, and pro-business climate make it **highly competitive for data center expansion**. Through advanced Core Suitability Models (CSMs) and expert site analysis, the SSI: Data Center project identifies and prepares priority sites, creating a foundation for Indiana's future position as a premier data center destination.

NIPSCO Electric Service Area 20-County Study Region

DATACENTER LOCATION FACTORS

Power Availability

High-voltage grid connection of 50-100+ MW

Large Contiguous Land

Large campus footprint with expansion room

Fiber Connectivity

Multiple high-bandwidth network routes

Hyperscale Data Center

Massive facility designed to support immense computing and storage demands of cloud providers and large enterprises

Transportation Features

Highway access for construction logistics and operations support

Water Supply

Access to water or innovative cooling systems

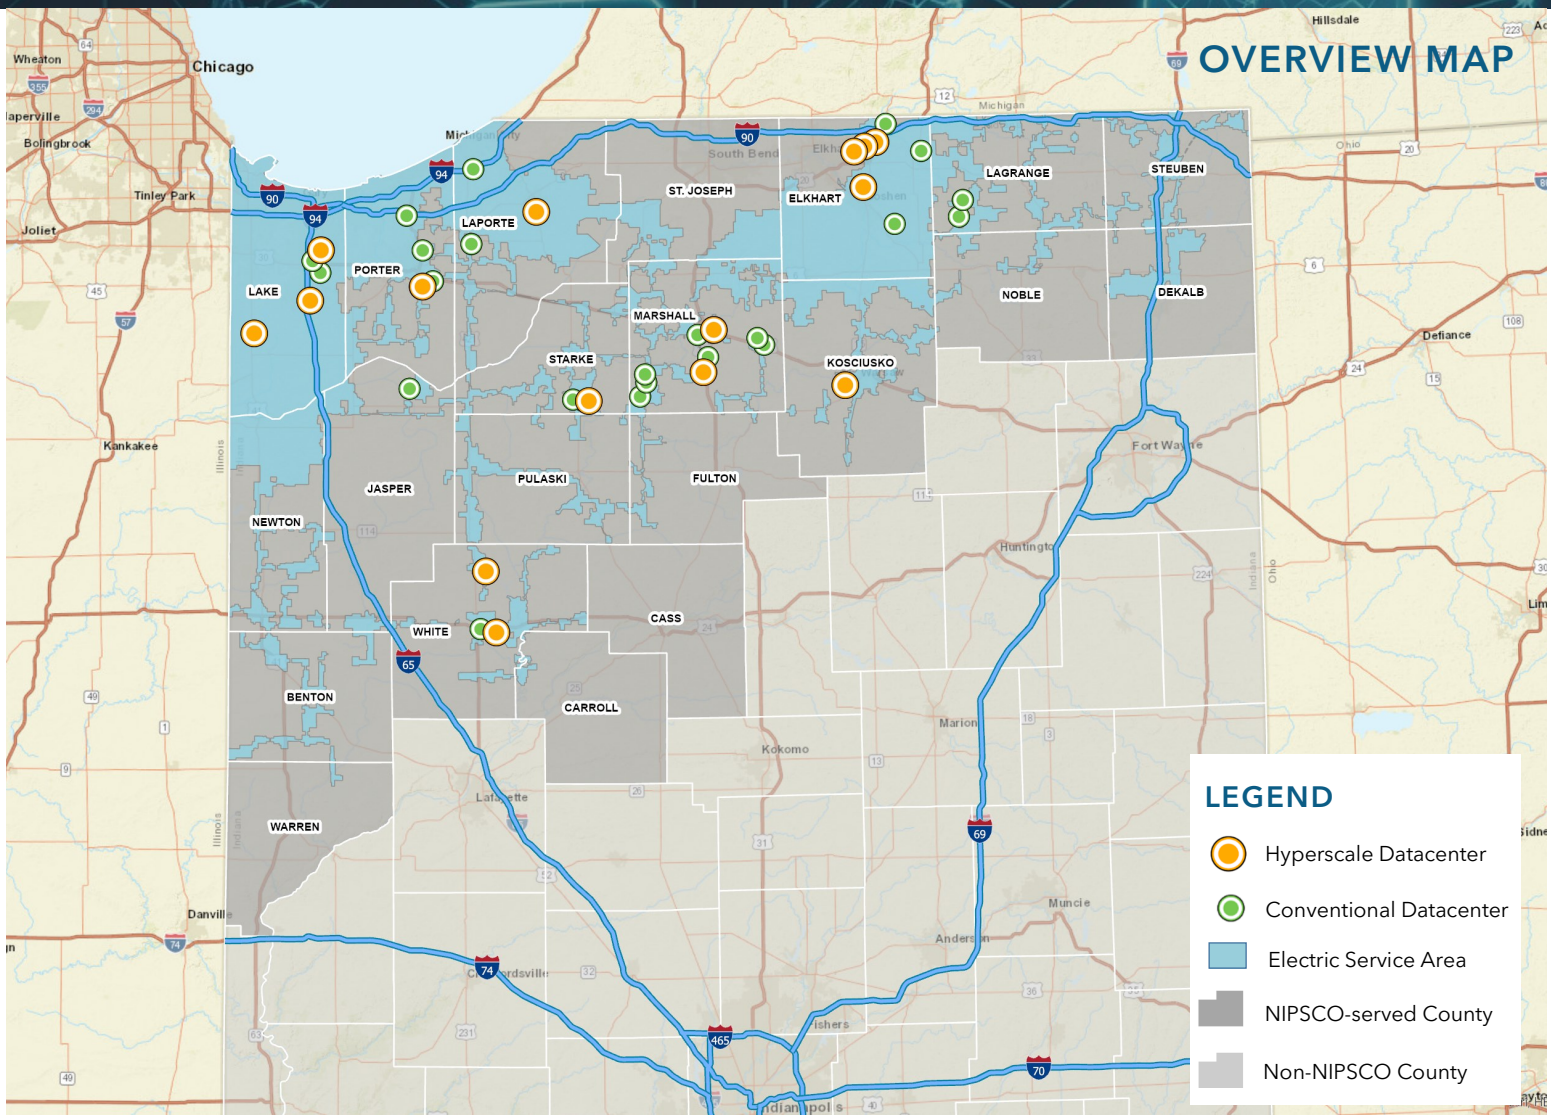

Risk & Hazard Avoidance

Avoid environmental hazards and incompatible land uses

SSI: Data Center Results

INDIANA FOR THE BOLD NIPSCO

OVERVIEW MAP

KEY FINDINGS AND SITE STATISTICS

15 hyperscale data centers

A hyperscale data center is a campus-scale facility—***often 500–1,000+ acres***—designed for 100–500+ MW of reliable power, multiple fiber-optic carriers, and extensive cooling infrastructure, supporting thousands of servers and global cloud services across ***multiple interconnected buildings***.

23 conventional data centers

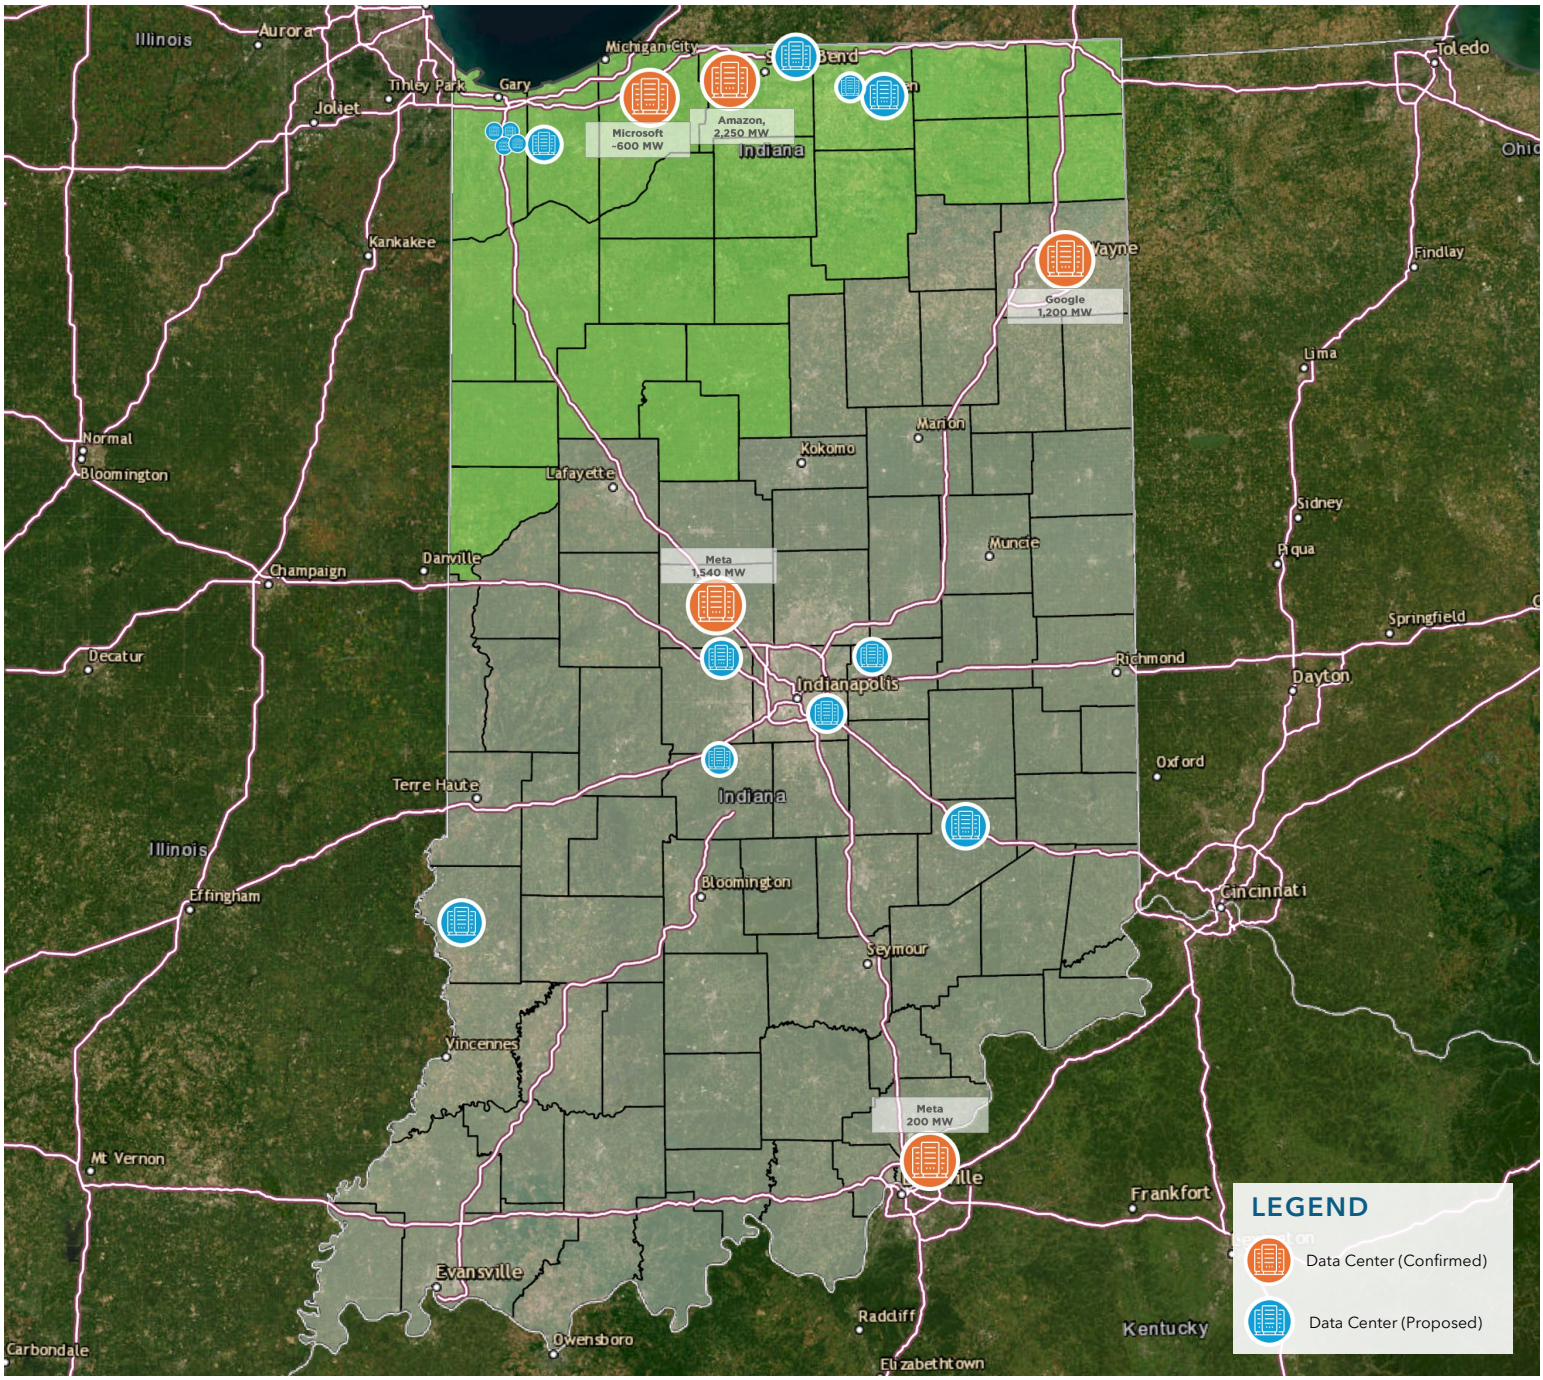

A conventional data center typically occupies ***200-500 acres***, draws 50–200 MW of power, and may consist of a ***single building or modest campus*** serving colocation customers or enterprise IT needs.

Site Development Update: Screening took place in June–August 2024, during which a wide range of potential data center locations were identified across NIPSCO's electric service territory. As of April 2025, some of those sites have moved into formal proposal or permitting phases for hyperscale and mid-scale data center construction, while others remain in exploratory or concept stages. Regular status reviews are advised to capture ongoing shifts in developer interest and emerging opportunities.

SSI: Data Center State Overview

INDIANA FOR THE BOLD NIPSCO

INDIANA'S DATA CENTER FOOTPRINT

STATEWIDE CAPACITY GROWTH

The State of Indiana now hosts ***several of the largest data center projects in the nation***. AWS (2250 MW) and Meta's potential 1540 MW campus are record-setting in size, and Google and Microsoft are each bringing 500–1200 MW-class facilities. Indiana already has roughly 4 GW of "big-load" capacity in the pipeline—and ***needs another ~4.2 GW to meet projected 2030 demand***.

Definitive numbers are still evolving as projects move from proposal to construction. However, the best available data (from regulatory filings and public announcements) confirms several thousand megawatts of new demand from data centers are already in progress. These findings underscore ***Indiana's emergence as a central US data center destination*** and highlight the urgent need for development-ready sites to meet rising demand by 2030.

Indiana Data Center Capacity Growth (2024-2030)
