Boone County Vicinity

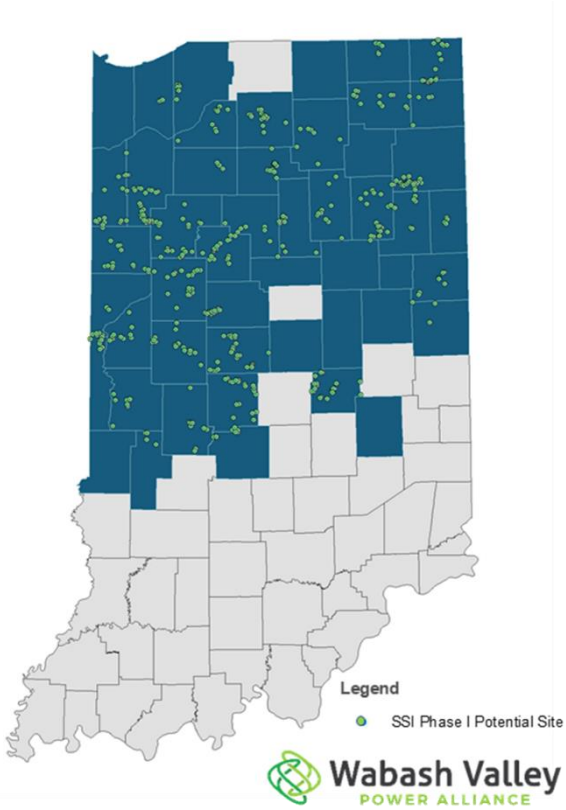

Introduction

This report presents the findings of the Strategic Sites Inventory (SSI) Phase II: Preliminary Due Diligence assessment of Site ID 18011-002 (referred to as the "Jamestown Industrial Site"), a 225.3-acre greenfield property located near the town of Jamestown in Boone County, Indiana. Jamestown is located near the larger city of Lebanon, which serves as the county seat. The Jamestown Industrial Site was nominated for advancement to SSI Phase II by officials from Boone County (Boone Economic Development Corporation) and Wabash Valley Power Authority (WVPA). WVPA is a non-profit electric cooperative serving an alliance of 23 member distribution co-ops across Indiana, Illinois, and Missouri. *The subject site satisfies baseline quality criteria, aligns with Boone County industry targets, and is deemed competitive to attract high-value business investments in support of sustainable community job growth and economic prosperity.* Report site maps are included as **Appendix A**.

SSI QUALIFIED SITE

The SSI Program is an advance site selection initiative designed to develop an inventory of strategic real estate assets to attract quality job-creating business investments. In 2019, the Indiana Economic Development Corporation (IEDC) initiated the Strategic Sites Inventory (SSI) Program in the State of Indiana with *SSI Phase I: Site Discovery* for all 92 counties with a goal to increase economic development competitiveness at the community level by identifying new, top quality raw land sites ideally suited for industrial and commercial projects. Boone County was included in the initial IEDC-funded project and benefitted from the identification of one potential high-value site for mega site and heavy industrial land uses. A subsequent investment by IEDC in 2020 included expanded SSI Phase I site searches to identify light industrial and agribusiness sites, increasing Parke County's total of quality SSI-identified sites to thirty-three. One Technology Megasite has been identified in Boone County. A total of 463 sites have been identified within WPVA's served territory.

Site ID 18011-002 was identified from the expanded 2020 IEDC-funded SSI Phase I project for light industrial and agribusiness land uses, and the site boundary was later adjusted as proposed by Boone County officials. The subject site exhibits necessary competitive characteristics for SSI Phase II: Preliminary Due Diligence nomination. Details about the SSI Program phases are provided in **Appendix B**.

Leotta Location and Design (LL+D) has developed a systematic and effective methodology for screening potential sites for practical development as part of the SSI Phase II process. LL+D's site screening methodology is informed by fifteen-plus years of industrial and commercial site selection experience and economic development consulting in conjunction with demonstrated geospatial technology-based analysis and mapping expertise. LL+D staff and consulting partners include environmental science, civil and geotechnical engineering, landscape architecture, geospatial technologies, and economic devolvement experts who combine disciplines to identify and evaluate sites for industrial and commercial project uses.

The purpose of the SSI Phase II study is to provide a quantitative understanding of the subject site's advantages and challenges in conjunction with a rough order-of-magnitude (ROM) cost estimate to improve site functional use and mitigate development challenges. The SSI Phase II study is a desktop-based preliminary engineering and environmental due diligence exercise performed by discipline-specific experts with experience in industrial and commercial site selection and property development. Study of the subject site's physical and surrounding characteristics, assets, and impediments for development are reviewed in sufficient detail to formulate a defendable opinion on the competitive strength of the property for an economic development use.

The SSI Phase II study is intended to expose any potential "fatal flaws" that indicate significant development incumbrances or grossly compromise site competitiveness. The desktop review relies on an array of engineering, environmental, ecological, and cultural GIS data in conjunction with aerial imagery and available public records to assess current site development advantages and challenges. The SSI Phase II assessment concludes with the formulation of ROM cost estimates for improving site functional use and mitigating any potential development challenges.

LL+D's team of site selection and economic development experts provided an in-depth study of the subject site through an objective measure of physical features and surrounding characteristics and conditions across engineering, environmental, ecological, and cultural concerns. Overall site competitiveness for an economic development land use is made within the context of location requirements for permitting, construction, and operations relevant to the intended site project land use.

The SSI Phase II findings are expressed along three principal site assessment parameters:

Condition of the site's physical characteristics including assessment of engineering and environmental development advantages and challenges.

Connection to transportation assets, utility infrastructure, and major market areas.

Community support including available workforce, cultural feature impacts, and business climate for economic development.

A description of the subject site and summary of SSI Phase II findings is provided below.

Site Description

The Jamestown Industrial Site is an undeveloped (greenfield) property approximately 225.3 acres in total size located adjacent to Interstate 74 (I-74) and along Indiana State Road 75 (SR-75) outside the town of Jamestown, Indiana. The subject site is comprised of five tax parcels, or tracts, independently owned by two landowners of record. **Appendix C** provides a summary of site parcel ownership information.

Site ID 18011-002 southwest view from I-74.

Current site condition is characterized by farmed agricultural land for the majority of the site. The property has historically been used for crop production. The site also contains a pond in its north-central portion and sparse patches of forested space. A group of farming-related structures is currently observed within the site boundary. These are contained in approximately 4 acres of the site at the northwest corner. Land use surrounding the site is primarily agricultural with some residential land use directly to the south and southwest. A stamping and welding manufacturer called Fukai Toyotetsu Indiana Corp (FTIC) is located adjacent to the site's eastern boundary. The $73 million FTIC plant is a joint venture between Fukai Manufacturing Company and Toyoda Iron Works Company and supplies parts to Japanese automaker Suburu, who has a major assembly plant in Lafayette, Indiana. A church, cemetery, and medical practice exist nearby to the southeast. Commercial or residential activity near the site presents no significant impact.

The cultural setting is rural with the town of Jamestown located directly south of the subject site. The site is bordered by I-74 to the north and SR-75 to the east. *A contiguous "buildable area" was defined within the confines of the subject site boundary intended to be most advantageous for construction. The Jamestown Industrial Site buildable area is approximately 180.9 acres and encompasses the majority of total site acreage. The buildable area has been defined to avoid a pond in the north-central portion of the site.*

Geographic Location

Located in Central Indiana, Boone County provides a rural setting close to a metropolitan area. The county touches Marion County, home to Indianapolis, to the southeast. It is situated along the high-commercial activity I-65 and I-74 corridors with access to major markets throughout the state. The I-65 corridor connects Indianapolis to Chicago, IL and Louisville, KY, while the I-74 corridor connects Indianapolis to Cincinnati, OH and Champaign, IL. *In direct linear measure, the site is situated approximately 18 miles west of Indianapolis, IN; 83 miles east of Champaign, IL; 105 miles southwest of Fort Wayne, IN; 120 miles northwest of Louisville, KY; 125 miles northwest of Cincinnati, OH; 127 miles southeast of Chicago, IL; and 185 miles west of Columbus, OH.* Projects considering the Jamestown Industrial Site will benefit from locating in a rural community largely avoiding traffic congestion, cumbersome permitting processes, and

higher land costs typical of urbanized areas while being within close reach of a metropolitan community strongly embedded in economic growth and prosperity amongst a primary network of connectivity. Access to surrounding labor markets at competitive wage rates is well within reach of the subject site. A map of site proximity to major metropolitan areas is provided in **Appendix A**.

Site ID 18011-002 Site Vicinity

The subject site is located outside the municipal limits of the town of Jamestown, which has a 2021 estimated population of 952. Jamestown is part of the Jackson Township, one of twelve townships in Boone County that has a population of approximately 2,731. Lebanon serves as the county seat for Boone County, which has an estimated county population of 73,052. *More than 956,767 total residential population live within a 45-minute drive of the site. Approximately 68,709 businesses employing 1,048,114 people are located within a 60-minute travel time.* Construction, manufacturing, and professional, scientific, & technical services account for 19.8% of businesses employing 24.6% of total workforce within a 60-minute drive of the site. A site vicinity map is provided in **Appendix A**.

Current Ownership

The subject site is comprised of five contiguous tax parcels, or tracts, and is reported by Boone County officials to have two owners. *According to county-provided information, the current owners of record are Charleen Purdy and John Levinsohn/Steve Fritsch. The subject site is comprised of five tracts of approximately 21.2, 33.7, 41.0, 48.8, and 80.6 acres according to Esri GIS data.* Boone County economic development officials have stated that no site parcels are currently listed for sale, but that the Levinsohn owners would consider real estate joint venture (JV) development or sale. It was also mentioned that the 80-acre Purdy-owned parcel (Parcel Number 0050624000) contains the owner's farm and may present challenges regarding desire to sell. As of the date of this report, no known real estate purchase option agreement is held with any person or organization with the landowner for any portion of the site. *LL+D strongly recommends that Boone County pursue and secure a real estate purchase option agreement with the landowner. This is critically important to reduce uncertainty regarding property availability and price*. A "Site Parcel Configuration" map is included in **Appendix A**.

Findings Summary

The findings from the SSI Phase II study are summarized below. A discussion of key site development considerations is provided within the context of overall site physical **condition**, **connection** to infrastructure, and **community** support. LL+D's site competitiveness assessment across these key site development parameters are presented below.

Condition

Site conditions are defined as the physical characteristics of the subject property including geometric configuration, surface features, engineering, ecological and environmental concerns, and land use compatibility. *Overall, conditions for the Jamestown Industrial Site are favorable for development for the site's highest and best use as an economic development real estate asset*.

Size and Configuration of the subject site is sufficient in both acreage and configuration to support a *Light Industrial, R&D Technology Park, and/or General Agribusiness operation. Total site area is approximately 225.1 acres, measuring approximately 3,590 feet across an east-west axis at its widest point and approximately 4,498 feet across a north-south axis*. The site is geometrically regular in configuration with adequate land between site boundaries providing ample acreage for a contiguous buildable area. The eastern site boundary is bordered by the Fukai Toyotetsu Indiana Corp (FTIC) manufacturing plant and Old Union Road, the site's primary access road. Interstate 75 (I-75) runs along a portion of the site's northern boundary providing approximately 1,300' feet (0.25 miles) of interstate frontage.

A contiguous buildable area totaling 180.9 acres has been defined to optimize facility construction on the site by positioning an operational footprint to avoid wet areas and a residential buffer zone. The buildable area occupies the majority of the site and is comprised of 5 individual tracts. Site access is supported by multiple potential ingress/egress points located on Old Union Road and IN State Road 75 along the site's eastern boundary.

Hydrography and Flood Risk were evaluated by consulting USGS National Hydrography Dataset (NHD), a geospatial database which identifies stream segments or reaches that make up the nation's surface water drainage system, and FEMA National Flood Hazard Layer (NFHL), a geospatial database that contains current effective flood hazard data. *Based on a review of NHD and NFHL data, the site and buildable area are highly favorable for site development with low flood risk and minimal recorded/observed significant hydrography features. 100% of the site is outside the FEMA-designated flood hazard area and is designated as Flood Zone X (within 0.2-percent-annual-chance flood or 500-year floodplain). The site is within approximately 0.8 miles of Flood Zone A to the southeast. However, this is not seen as a threat to the subject site since the site sits approximately 50 feet higher than the area in the flood zone.* A hydrography and FEMA flood hazard map is provided in **Appendix A**.

Potential Wetlands are interpolated through observation of multiple data inputs including:

1) USGS National Wetlands Inventory (NWI) – developed for non-404 jurisdictional wetland mapping, so must be understood to have limited accuracy
2) LiDAR-derived digital elevation model (DEM) – topography/elevation
3) USGS NHD – hydrography
4) NRCS SSURGO – soils data provides hydric rating
5) Color-infrared imagery (where available) – for visual indication of wet or inundated areas (consulting differing years to ensure wet areas are not the result of a period flood event)

The NWI data is consulted as the principal indicator of potential wetlands, as the mapping methodology utilizes the above-referenced inputs in addition to other data sources in conjunction with qualified scientific review and quality control of interpolated wetlands delineation and taxonomy. The NWI data also provides a delineation of wetland types, which is important in the estimation of permitting burden and potential compensatory mitigation costs. The additional data sources are consulted to ensure congruency of information suggestive of potential wetlands occurrence.

From the US EPA Wetland Regulatory Authority fact sheet, wetlands subject to Clean Water Act Section 404 are defined as "areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas." There are three primary conditions required for surface areas to be considered wetlands: 1) at least periodically, the land supports predominantly hydrophytes, 2) the substrate is predominantly undrained hydric soil, and 3) the substrate is saturated with water or covered by shallow water at some time during the growing season of each year. As determined by the U.S. Army Corps of Engineers, the federal agency responsible for enforcing federal laws protecting wetlands, an area must exhibit all three of the above-referenced conditions to be considered a wetland.

Aerial Imagery of Onsite Potential Wetlands (Google Earth 2023)

The following GIS-based information was consulted for the desktop wetlands assessment:

- **Hydrophytic Vegetation**: Recent and historical aerial imagery and NWI data.
- **Wetland Hydrology**: LiDAR-derived DEM, USGS topo maps, and high-resolution aerial imagery.
- **Hydric Soils**: NRCS Web Soil Survey and SSURGO data.

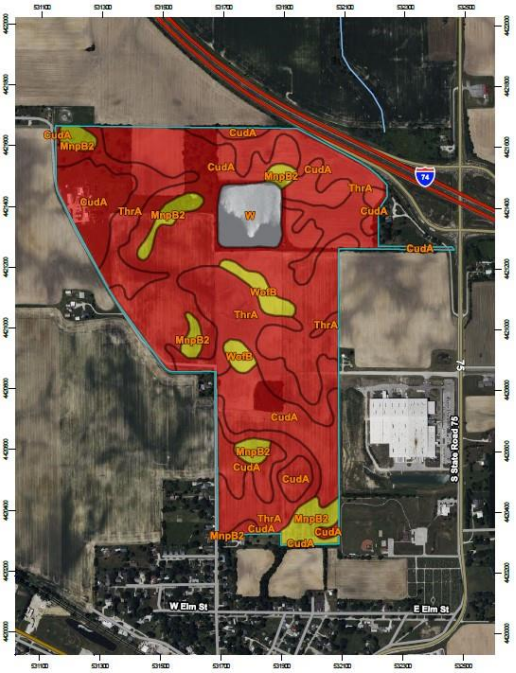

There are approximately 13.6 acres of potential wetlands reported on the subject site. The wetland areas are located on the central northern portion of the site and are classified as "freshwater pond" and freshwater emergent" wetlands. Emergent wetlands are a transitional area between permanently wet and dry environments. It is a place where the land "emerges" from the water to join the forest and the plants that grow there. *According to the SSURGO Hydrologic Soil Group map, 68.6% of the total site has soils estimated to have hydric components. While no potential wetlands are reported within the buildable area, wetland permitting and mitigation may be required on the subject site. This appears to pose minimal development impediments to the site*. NWI potential wetlands map is provided as **Appendix A**.

Soils conditions are assessed to identify potential advantages and/or challenges that could have an impact on site design, construction, and overall use of the site. Soil types are evaluated with respect to

drainage and engineering performance for excavations, road construction, and building foundation support. Additionally, hydric soil ratings are used in conjunction with wetlands data to increase confidence in potential wetlands interpretation (reported in previous section).

According to the United States Department of Agriculture (USDA), Natural Resource Conservation Service (NRCS) Soil Survey Geographic Database (SSURGO) accessed via the NRCS Web Soil Survey, *54.5% (122.8 acres) of the subject site soils are classified as "Crosby silt loam, fine-loamy" with a drainage class of "somewhat poorly drained." Additionally, 6.9% (15.4 acres) and 2.5% (5.6 acres) of the subject site are classified as "Miami silt loam" and "Williamstown-Crosby silt loams" with drainage classes of moderately well drained. Lastly, 31.4% (70.7 acres) of the subject site are classified as Treat silty clay loam with a drainage class of poorly drained.* These soils are assigned to SSURGO hydrologic soil groups and have slow infiltration rates with high runoff potential.

Soil suitability properties for small commercial building construction across 85.9% (193.5 acres) of the subject site are indicated as "Very limited" for shallow (2-feet deep) reinforced concrete spread footings. A small portion (9.4% - 21 acres) of soils within the site boundary are indicated as "Somewhat Limited" for small commercial building construction. Substantial foundation requirements may not be supported by site soil conditions and must be determined through on-site geotechnical engineering investigation. The limitations can be overcome or minimized by special planning, design, or installation.

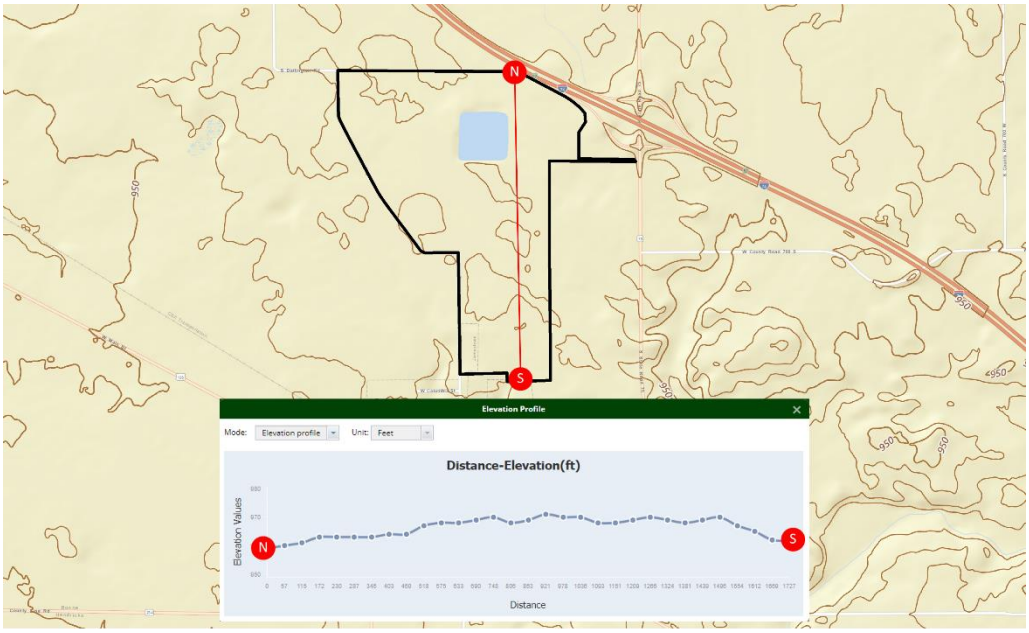

SSURGO Small Commercial Building Rating "Very Limited"

A SSURGO soils map is provided in **Appendix A**. The USDA, NRCR SSURGO soils reports for drainage class, small commercial buildings, and hydric rating are provided in **Appendix G**.

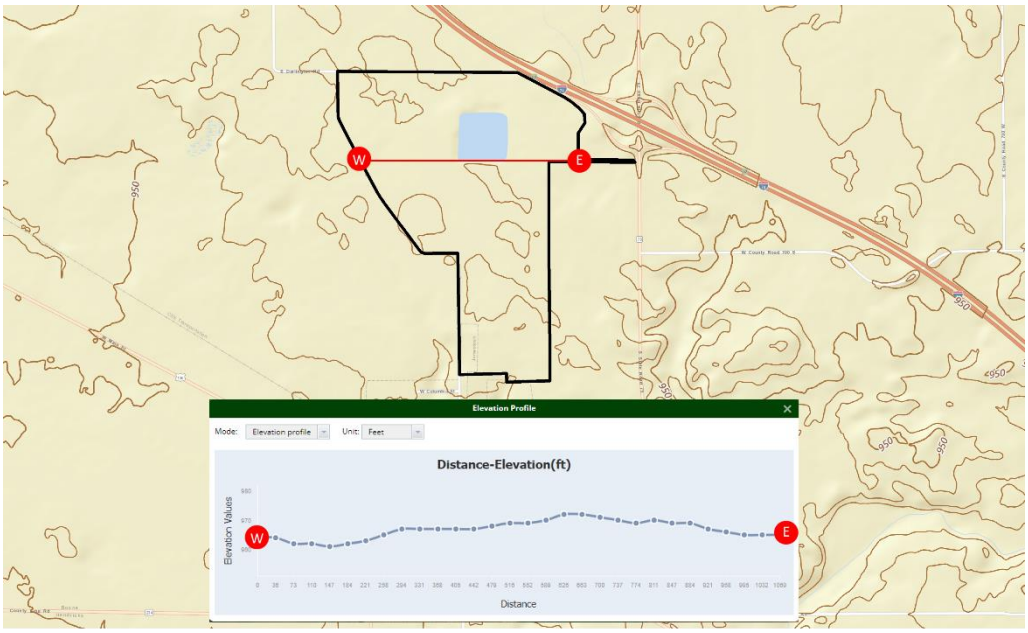

Sinkholes are common geological phenomenon occurring throughout the United States. They are only one of many kinds of karst landforms, which include caves, disappearing streams, springs, and underground drainage systems. Karst is a generic term which refers to the characteristic terrain produced by erosional processes associated with the chemical weathering and dissolution of limestone or dolomite.

The Sinkhole Areas and Sinking-Stream Basins Map developed by the Indiana Geological Survey shows the locations of sinkhole areas (SHA) and sinking-stream basins (SSB) in southern Indiana. Some sinkholes may exist outside the delineated areas, and some sinkholes may exist within the areas designated as sinking-stream basins, but such areas are not shown in this map. *The subject site lies entirely outside of the SHA and SSB areas, and thus should not be at risk of sinkholes.* The reliability of reported sinkhole occurrences is unknown. Potential site susceptibility to sinkholes must be determined through more thorough professional geological and geotechnical engineering investigation.

Elevation/Topography presents minor grading challenges to prepare the site for development. *Based on a review of 5-meter cell size, LiDAR-derived digital elevation models (DEM) for the full site extent, a minimum elevation of 957 feet mean sea level (MSL) and maximum elevation of 976 feet MSL is reported. The 2021-2022 DEM indicates an average buildable area elevation of 966.8 feet MSL and average slope of 1.01 percent*.

18011-002 Elevation Profile North-South (USGS 3DEP Viewer)

18011-002 Elevation Profile West-East (USGS 3DEP Viewer)

The majority of the site is generally flat and without significant sloping. The lowest elevation occurs along the northernmost boundary; the central and southern portions of the site generally have higher elevation and less slope. With the flat topography, there are not likely many cut-fill opportunities for use of onsite fill for grading/leveling. This analysis is subject to an onsite geotechnical engineering investigation to determine suitability of soil properties for construction. Additionally, any areas of naturally occurring sloping topography may provide passive locations for site buildable area drainage and stormwater retention. A LiDAR-derived DEM and 10-ft contour map is provided as **Appendix A**.

Land Cover assessment is useful for identifying site design constraints and/or potential encumbrances that may be encountered during site development such as extensive clearing and grubbing, drainage concerns, etc. The vegetative cover type is used in conjunction with soil types, elevation, and hydrography data for interpretation of environmentally sensitive conditions such as wetlands and potential habitat for Threatened and Endangered (T&E) species and other species of concern (discussed later in this report). Certain land cover features may reveal commercial value of forested areas or be desirable to incorporate into the site design. Features such as densely wooded areas may provide a desirable buffer during construction and/or during facility operations for line of sight and noise control. Another example is integrating wetland areas into site plans, thus providing an element of design aesthetics.

Two primary sources were used to assess land cover characteristics:

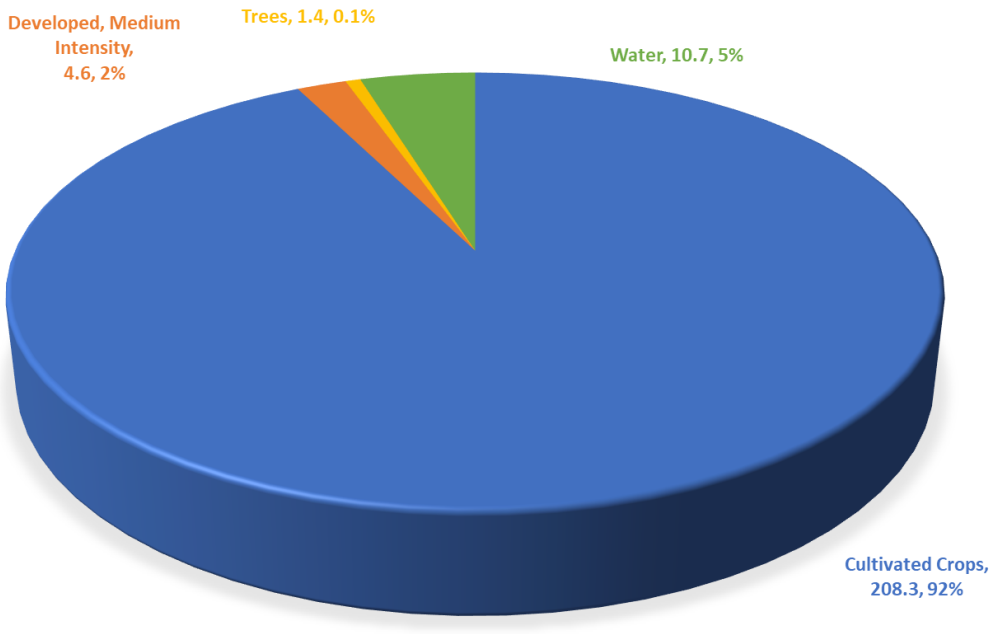

1) *Recent high-resolution color aerial imagery* (ESRI/Google Earth 2022). Recent and past aerial imagery provide useful observational data for assessing current land cover conditions, as well as any notable changes over time. However, aerial imagery alone cannot be used without additional data sources to provide a more specific delineation of land cover type. For example, densely wooded areas are readily observed from aerial imagery, however, determination of forest composition is largely indeterminate without other remotely sensed inputs (i.e., color infrared imagery) or ground-based observation.

2) *The Multi-Resolution Land Characteristics Consortium (MRLC), National Land Cover Database (NLCD)*. The National Land Cover Database (NLCD) provides nationwide data on land cover and land cover change at a 30m resolution with a 16-class legend based on a modified Anderson Level II classification system. NLCD 2019 represents the latest evolution of NLCD land cover products focused on providing innovative land cover and land cover change data for the Nation. NLCD 2019 offers 8 integrated epochs of land cover for years 2001, 2004, 2006, 2008, 2011, 2013, 2016, and 2019. Developed classes in these years are directly derived from percent developed impervious surface and include a descriptor label that identifies the type of each impervious surface pixel. The NLCD Land Cover change index combines information from all years of land cover change and provides a simple and comprehensive way to visualize change from all 8 dates of land cover in a single layer.

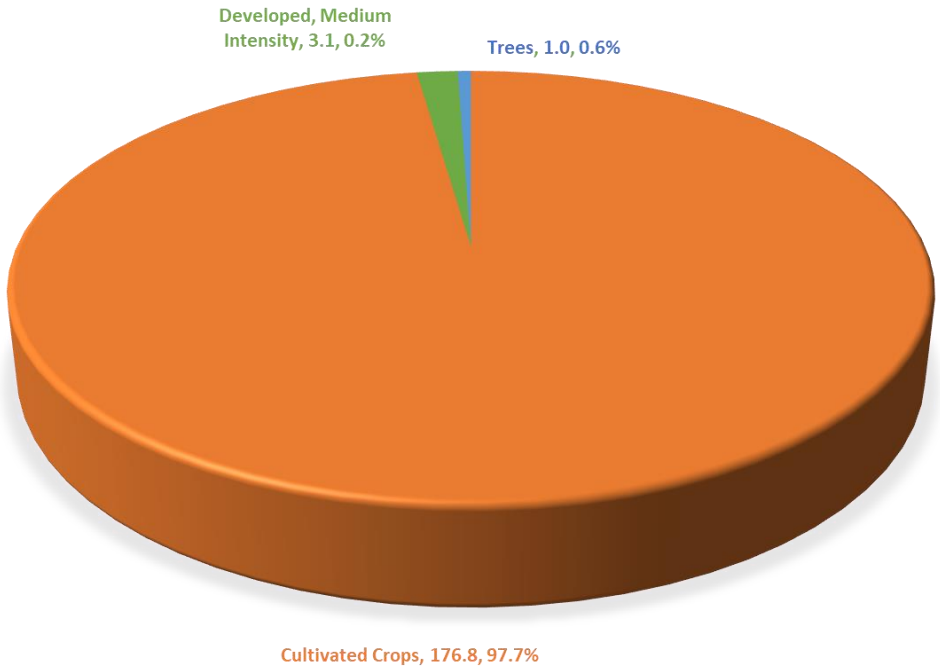

Based on a review of the MRLC NLCD dataset, land cover for the site and buildable area consists of the following classified areas (acres, percent cover):

A Land cover map is provided in **Appendix A**.

Land Cover – Site (acres, %)

Land Cover – Buildable Area (acres, %)

Zoning and Land Use is administered and governed by the Boone County Zoning Ordinance and the Jamestown Unified Development Ordinance. *According to the SSI Pre-Project Questionnaire, the site is currently zoned Agricultural and R-1. Four of the five site parcels are not inside the town limits of Jamestown and are under the jurisdiction of the Boone County Area Plan Commission with Vacant Agricultural zoning, while a single tract in the southwestern portion of the site is zoned R-1 Low Density Single Family Residential by the Town of Jamestown. The 2017 Jamestown Comprehensive Plan future land use map calls for all site parcels to be industrial.* Zoning Maps are provided in **Appendix D.**

The apparent current land use of the subject site is derived from the SSI Pre-Project Questionnaire, the 2017 Jamestown Comprehensive Plan, the 2009 Boone County Area Comprehensive Plan, recent aerial imagery, and Google Street View. *Recent aerial imagery shows current land use to be agricultural/crop production as evidenced by minimal forested areas and lack of commercial structures. The site is primarily comprised of open agricultural space but also contains a pond in the north-central portion, farming-related structures within approximately 4 acres of the northwestern portion, and sparse forested space. The aerial imagery-derived land use observations for the site agree with the 2009 Boone County Area Comprehensive Plan's Agricultural designation and information provided by Boone County in the SSI Pre-Project Questionnaire. It also matches the NLC Database – Cultivated Crops (92%) land cover classifications.*

Current land use immediately surrounding the subject site to the west, north, and south consists mainly of agricultural lands and residential properties. An automotive parts manufacturer is located adjacent to the site's eastern boundary. A church and cemetery also exist southeast of the site.

There is little to no indication of other land uses within the site boundary over the last eighty-four years based on a review of historical aerial imagery dating to 1939 (provided by the EDR Radius report). Fifteen epochs from 1939 to 2020 were reviewed to determine the sequential occupancy of the subject site. Since 1939, the subject site has been consistently used for agriculture. Between 1955 and 1969, a pond was constructed near the northern site boundary. Residential and farm structures have remained in the northwestern portion of the site since 1939. A forested area approximately 1,600' south of the pond has remained in place throughout the series of images. Historical aerial imagery is included in the EDR Radius Report provided as **Appendix H**.

Current site land use is ideal to support future development of the site for industrial/manufacturing, general agribusiness, and R&D tech land uses. Surrounding tract land use is mostly compatible with the intended site use immediately around the buildable area. While residential areas exist to the southwest and a nearby church and cemetery are located to the southeast, adequate buffer should mediate any development objections. The nearby future land use is indicated from the 2017 Jamestown Comprehensive Plan to be Industrial to the north and west, Agricultural and Commercial to the east, Single Family Residential to the south, and Public and Semi directly southeast. *Tracts surrounding the subject site, and especially the buildable area, should be considered for rezoning with uses that are compatible with the intended industrial uses of the site. Compatibility with surrounding land use is vital to preserving the competitiveness of the site for an economic development use by preventing encroachment of land uses that would create real or perceived risk to prospective business considering the site for development.*

Relevant excerpts from the Boone County Zoning Ordinance, the Jamestown Unified Development Ordinance, the 2017 Jamestown Comprehensive Plan, the 2009 Boone County Area Comprehensive Plan prescribing zoning and land use polices, standards, and statutory requirements for land development are included in **Appendix D**. Officials from Parke County Planning & Zoning should be consulted for detailed requirements pertaining to land use and zoning district designations.

Threatened and Endangered Species are defined under the federal Endangered Species Act (ESA) of 1973. The ESA provides a program for the conservation of threatened and endangered (T&E) plants and animals and the habitats in which they are found. The lead federal agencies for implementing ESA are the U.S. Fish and Wildlife Service (USFWS) and the U.S. National Oceanic and Atmospheric Administration (NOAA) Fisheries Service. The USFWS maintains a worldwide list of endangered species. Species include birds, insects, fish, reptiles, mammals, crustaceans, flowers, grasses, and trees.

The ESA defines an *endangered species* as "any species which is in danger of extinction throughout all or a significant portion of its range." Endangered species are automatically protected by prohibitions of several types of "take," including harming, harassing, collecting, or killing, under Section 9 of the ESA. There are some limited exceptions to these rules listed in Section 10 of the ESA. The ESA defines a *threatened species* as "any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range." Threatened species receive protections through separate regulations issued under Section 4(d) of the ESA.

LL+D staff consulted the USFWS Information for Planning and Consultation (IPaC) online tool (https://ipac.ecosphere.fws.gov/) to assess potential project effect on listed species (*a plant or animal that receives federal protections under the Endangered Species Act. Species can be protected as endangered or threatened*) and other USFWS trust resources (*includes migratory birds, species listed as threatened and endangered under the Endangered Species Act, interjurisdictional fishes, marine mammals, wetlands, and lands managed by USFWS, such as national wildlife refuges*). The IPaC tool is a project planning tool that streamlines the USFWS environmental review process.

An IPaC Resource List was generated for the subject site. The Resource List is a report that automatically generates a list of species and other resources such as critical habitat (collectively referred to as trust resources) under USFWS jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

The IPaC trust resources report lists critical habitats and species of concern known or suspected to be found in habitats within regional ecology. The IPaC trust resources report found that the following species may potentially be affected by activities in this location:

- **Mammals**:
    - Indiana Bat (*Myotis sodalist*) – Endangered
    - Northern Long-eared Bat (*Myotis septentrionalis*) – Endangered
    - Tricolored Bat (*Perimyotis subflavus*) – Proposed Endangered
- **Birds:**
    - Whooping Crane (*Grus americana*) – Experimental Population, Non-Essential
- **Insects**:
    - Monarch Butterfly (*Danaus plexippus*) – Candidate
- **Critical Habitats**:
    - There are no critical habitats at this location.

The IPaC report also identifies the Migratory Birds Resource List that identifies certain birds protected under the Migratory Bird Treaty Act of 1918 and the Bald and Golden Eagle Protection Act of 1940. Birds listed in the report are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention within the subject site location. The report does not include a list of every bird found within the site location, nor a guarantee that every bird on this list will be found within the site. The migratory bird list is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and altered to return a list of those birds reported as occurring in the 10km grid cell(s) that intersect the specified site study area location and have been identified as warranting special attention because they are a BCC species or an eagle (Eagle Protection Act requirements may apply) in that area.

The IPaC Migratory Birds Resource List (MBRL) provides a "Probability of Presence" summary indicating the best understanding of when birds of concern are most likely to be present in the site area. *While there is no immediate known impact to site development, the MBRL should be further reviewed within the context of environmental permitting requirements by a qualified environmental/ecological consultant, as temporal migratory bird presence may affect the timing of certain construction-related activities on the subject site*. The IPaC trust resources report is provided in **Appendix E**.

Legacy Environmental Concerns consist of historical activities and events both on the subject site and on nearby tracts where harmful contaminants were released into soil, surface water, and groundwater. If not properly remediated under state and federal regulatory requirements by qualified environmental consultants/contractors, historical contamination liabilities may be inherited through chain of title even if the contamination originated offsite, particularly with migration through groundwater transport. The historical environmental event implication for site development depends on many factors including the type, extent, concentration, complexity, physical setting and surface/subsurface conditions, and time since the event, which may or may not pose a risk to prospective investors on site development.

A cursory review of the subject site and surrounding properties was conducted to identify any potential legacy environmental concerns. Informational resources consulted for this review include:

- EDR Radius Report;
- Recent and historical aerial imagery review;
- US Environmental Protection Agency's (EPA) Enforcement and Compliance History Online (ECHO) database (EDR Radius Report limits ECHO database search to the target property); and
- Information provided through interviews with local political officials, economic development representatives, and landowners (where available)

The EDR Radius Report searches environmental databases for permitted facilities, events, and other potential concerns occurring on the subject site and up to 1.0 mile of the site boundary. EDR use statement: "*A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate*".

Based on the results of the EDR Radius Report and a cursory review of historical aerial imagery, two environmental legacy concerns were identified near the subject site. One "site" appearing in multiple databases was identified within 0.25 miles of the subject site in the EDR Mapped Sites Summary:

- ***FTIC Takenaka Corporation***
  - *Other names: Infrastructure for FTIC Development; FTIC Phase III Expansion*
  - *Databases: FINDS (Facility Index System/Facility Registry Systems), ECHO (Enforcement & Compliance History Information), NPDES (National Pollutant Discharge Elimination System), AIRS (Aerometric Information Retrieval System), TIER 2 (Hazardous materials facility listing)*
  - *Distance: within 200 feet*
  - *Elevation: lower (950' MSL)*
  - *Map ID* 1 *(overview map below)*

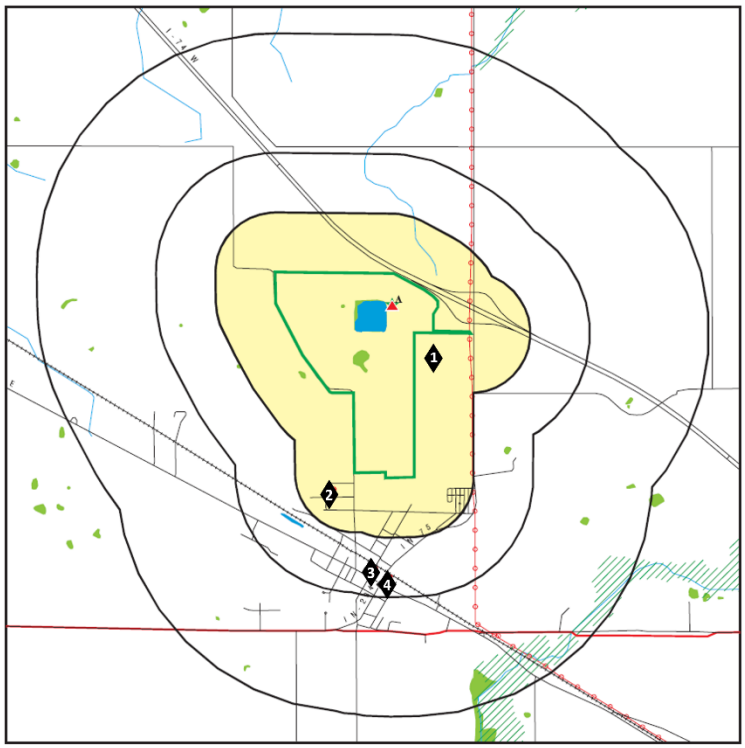

- ***Parker R Purdue***
  - *Database: OISC (Office of Indiana State Chemist Database)*
  - *Distance: within 1000 feet*
  - *Elevation: lower (954' MSL)*
  - *Map ID* 2

- ***Tri-Area Library***
  - *Database: SWRCY (Solid Waste Recycling Facilities)*
  - *Distance: within 0.5 miles*
  - *Elevation: lower (950' MSL)*
  - *Map ID* 3

- ***Corner Cupboard Mini Mart***
    - *Databases: LUST (Leaking Underground Storage Tank), UST (Underground Storage Tank), AUL (Activity and Use Limitations)*
    - *Distance: within 0.5 miles*
    - *Elevation: lower (946' MSL)*
    - *Map ID* ◆4

The Fukai Toyotetsu Indiana Corporation (FTIC) is located adjacent to the subject site's eastern boundary. The EDR Radius Report refers to this facility as the following: FTIC Takenaka Corporation, Infrastructure for FTIC Development, and FTIC Phase III Expansion (Map ID #1). The $73 million stamping and welding plant is a joint venture between Fukai Manufacturing Company and Toyoda Iron Works Company and supplies parts to Japanese automaker Subaru, who has a major assembly plant in Lafayette, Indiana.

The FTIC plant is listed in several databases including the Toxic Release Inventory (TRI), National Pollutant Discharge Elimination System (NPDES), and the EPA's Facility Registration Service (FRS). After a thorough review of the EDR Radius Report and the associated databases, it has been determined that the facility does not have any active or historical violations and proper management practices seem to be in place. The chemicals listed in the Toxic Release Inventory Facility report are manganese, copper, nickel, and chromium. Various entries involving Clean Water Act compliance permits have been reviewed; permit status appears to be in good standing and is set to expire on 5/23/23. There is no indication that there will be any problems with future permit issuing.

EDR Radius Report Mapped Sites Overview Map

Two of the three remaining sites listed in the EDR Mapped Sites Summary do not pose any threat to the subject site. *The Parker R Purdue facility (Map ID #2) is an agricultural wholesaler and turf pest management facility that is listed in the Office of Indiana State Chemist Database. The database shows that as of 12/31/22 additional credits are required for their continued operation. The Tri-Area Library (Map ID #3) is listed in the Solid Waste Recycling Facilities database as a recycler of mixed paper, magazines, and mixed residential wastes.*

The final site listed on the EDR Mapped Sites Summary is the Corner Cupboard Mini Mart (Map ID #4). This facility is an inactive gas station that is listed in several pollution databases: Underground Storage Tanks, Leaking Underground Storage Tanks, and Activity and Use Limitations. The property's groundwater has been affected by petroleum from the leaking underground storage tanks. The recorded date is listed as 12/10/2014. The facility should not pose an environmental concern for the subject site since it is at a lower elevation and over half a mile away. However, the extent of potential contamination resulting from the cited facilities may not be fully understood without conduction of more extensive environmental site investigations by a qualified consultant.

Full facility information is provided in the EDR Radius Report and is provided as **Appendix H**.

As the EDR Radius report limits environmental database searches to the subject site and within 1.0 mile of the subject site, the EPA ECHO database was consulted for potential significant environmental concerns within 2.0 miles of the site including active permitted facilities operating under the EPA Clean Water Act, Title V of the Clean Air Act, or the Resource Conservation and Recovery Act (RCRA) for control of solid waste. In limited instances, new air permit applications can be subject to more stringent requirements based on nearby existing permitted facilities' total air emission pollutant volumes and concentrations.

Based on the expanded ECHO search, no environmental legacy concerns were identified on the subject site.

ECHO Search results reported one facility with regulatory compliance violations of the Clean Water Act within the past three years: the Jamestown Wastewater Treatment plant. It is located approximately 0.8 miles southeast of the subject site. The violations are listed as "Effluent Violations – Numeric effluent violation" and "Management Practice Violations – Inflow/Infiltration". These appear to be minor issues and should have no consequence to the subject site. Based on the expanded ECHO search, no environmental legacy concerns were identified on the subject site. The ECHO site search results are provided in **Appendix H**.

As with any desktop research exercise, actual potential environmental concerns may not be fully recognized or understood without conducting an on-site field investigation. The industry standard for real estate environmental review is the Phase I Environmental Site Assessment (ESA). Governed by the ASTM E1527: *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* The Phase I ESA is designed to investigate property prior to ownership transfer or improvements for use to identify and document any existing or potential contamination that must be addressed or give cause for liability. The Phase I ESA methodology includes more detailed research and review of environmental databases, historical aerial imagery, title research, and on-site field observations of the subject site and immediately surrounding properties.

Connection

Site connectivity includes access to key transportation assets and utility infrastructure sufficient for the use intensity of the subject site. Access to available workforce is also measured within the context of the intended economic development project use (e.g., heavy industrial, light industrial, commercial/freight logistics, etc.). *The Jamestown Industrial Site is well connected to transportation and utility assets. In conjunction with strong community support, the site is well positioned for competitive response to light industrial/manufacturing, agribusiness, and R&D tech project opportunities.*

Transportation Assets are in place to serve the logistical needs of commercial/industrial business operations in the area. *Substantial transportation connections to the site include interstate frontage and direct access to a two-lane state highway.*

Access to the site is currently available via Old Union Road, a two-lane access road adjacent to the site's eastern boundary. The site could also potentially access State Road 75 (SR-75) via an easement that extends eastward from the property's northeast boundary. The site is also bordered by South Darlington Road to the west and Interstate 74 (I-74) to the north. From the site, truck traffic must travel approximately 0.2 miles east on Old Union Road to access Indiana State Road 75 (SR-75), a two-lane principal arterial highway. Traffic must then travel approximately 0.4 miles north to reach I-74, Exit 52. All roadways leading to interstate access appear to be in good condition and suitable for truck traffic, and the distance from the site to the interstate is considered an advantage for many industry types. A site access map is included in **Appendix A**.

Truck Routes accessible by the site include I-74 and US-136 for east-west travel and SR-75 for north-south travel. SR-75 is located directly east of the site and can be taken north or south to connect to US Highway 40 and several other state roads. I-74 access is located directly north of the site, while US-136 access is 1.1 miles south of the site. I-74 can be taken east for 20.7 miles to reach Indianapolis and multiple other truck routes including I-65, I-69, I-70, US-421, and US-31. SR-75 can also be taken south to US-136 before traveling east to Indianapolis. The site's proximity to several truck routes and being less than a mile from interstate access is considered an advantage. A transportation vicinity map is provided in **Appendix A**.

Railroad lines do not currently extend to the subject site and are not required for the intended light industrial/manufacturing, general agribusiness, and R&D tech project uses of the site. The nearest railroad is a CSXT Railroad line approximately 0.35 miles in direct linear measure south of the site into Jamestown. It may be economically feasible to construct a rail spur across a nearby agricultural field and S Darlington Road if desired by an industry. A transportation vicinity map is provided in **Appendix A**.

Airport access is beneficial for both corporate executives and other business-related representatives to travel to a facility during construction and when operational. Cargo airport

access provides an opportunity for transportation of process input materials and product distribution.

The Indianapolis International Airport (IND) is approximately 32.8 miles east (~30-minute drive) of the subject site providing passenger service. IND is home to the second largest FedEx Express hub in the world and was ranked as the sixth busiest U.S. airport in terms of air cargo throughput in 2020.

The Eagle Creek Airpark (EYE) is a public use airport located approximately 24.6 miles east of the subject site (~27-minute drive). It is owned by the Indianapolis Airport Authority and serves as a reliever airport for Indianapolis International Airport. The airport covers 315 acres and has one runway measuring 4,205 feet in length. EYE features Eagle Creek Aviation Services, and the airport's fixed-base operator (FBO) is an authorized service center for Cessna Citation, Cirrus Design and Twin Commander aircraft. ECAS is also one of the eight U.S. service centers for the Embraer Phenom.

The Purdue University Airport (LAF) is within 46.1 miles northwest of the subject site (~55-minute drive). LAF is a regional general aviation facility operating two runways at lengths of 6,600 and 4,220 feet. For the 12-month period ending December 31, 2019, the airport had 117,727 aircraft operations, an average of 322 per day: 99% general aviation, 1% air taxi, <1% military/commercial. The airport has commercial charter, corporate and cargo flights to support the aviation needs. LAF is one of the busiest airports in Indiana, second only to Indianapolis International Airport.

Seaport access is not required for the intended light industrial/manufacturing, general agribusiness, and R&D tech project uses of the site. However, the nearest seaport is Burns Harbor located within approximately 148 miles (~2.5-hour drive) north of the site. Burns Harbor is a port focused on steel, agriculture, and manufacturing located on Lake Michigan in the heart of the steel industry. Mount Vernon is another option that is approximately 214 miles away (~3.5-hour drive) south of the site. Mount Vernon handles more cargo than any other port in the state. With close proximity to the confluence of the Ohio and Mississippi rivers, it serves as a major gateway for agricultural, energy, and manufacturing industries.

Utility Infrastructure is optimal for the subject site. The Town of Jamestown provides water service and sewer lines, WVPA provides electric service, CenterPoint provides natural gas, and telecommunication services are available to the area from a nearby phone company or iLines, which is part of the Lebanon Utilities Telecommunications Division. Water, sewer, and electric lines are all located adjacent to the site. Water and sewer lines run along Old Union Rd. A single-phase electric distribution line borders the west edge of the property with an additional 3-phase line located within a mile of the site. Natural gas is located along State Road 75 (SR-75) within 1,400 feet east of the site boundary. Site utility information obtained from the "Local Site Survey Questionnaire" is provided as **Appendix J**. An energy infrastructure and utility access point map is provided as **Appendix A**.

Potable Water is provided by a 12" water main from the Town of Jamestown that runs along Old Union Rd adjacent to the site. The municipal potable water tank is a 150,000-gallon tank operating at 72 psi. Current and proposed water service flow/capacities are indeterminate and should be verified on a project-by-project basis with local water utility officials. Information provided by Boone County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Sewer/Wastewater service is provided municipally via a main line that runs along Old Union Rd adjacent to the site. There is a lift station designed to handle the area just east of the site boundary with two 65-gpm pumps. The Wastewater Treatment Plant (WWTP) has a capacity of 250,000 gallons per day (GPD) and is currently running at thirty percent capacity. Exact available capacity should be verified on a project-by-project basis with local wastewater utility officials. Information provided by Boone County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Natural Gas service is provided by CenterPoint Energy. An existing 8-inch medium pressure line with a maximum operating pressure of 195 psi is accessible to the site. The line runs along SR-75 and is located within 1,400 feet of the site's eastern boundary, which will likely require a slight extension. The exact current and proposed natural gas locations and capacities are indeterminate and should be verified on a project-by-project basis with Boone County officials. Information provided by Boone County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Electric power is provided by WVPA through its member distribution co-op, Boone REMC. A single-phase line is located adjacent to the site's western boundary. The site may also be served by a 3-Phase electric distribution line located less than a mile away. WVPA is currently working on capacity improvements. Exact locations of electric distribution lines and total available capacities are indeterminate and should be verified on a project-by-project basis with Boone County officials. Information provided by Boone County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Telco/Broadband distribution is provided to the site through a nearby telephone service provider and iLines, a local internet provider. Broadband currently exists in the area offered by the phone company and iLines. Fiber installation can also be provided by the phone company as a dedicated line. Information provided by Boone County in the "Local Site Survey Questionnaire" can be found in **Appendix J**. A utility infrastructure overview map can be found in **Appendix A**.

Major Market Areas are accessible within a two-hour drive of the subject site. By vehicular travel, the site is situated approximately 30.3 miles from Indianapolis to the southeast and 168 miles from Chicago to the northwest with 2021 total populations of 882,039 and 2,696,555, respectively. Travel distances to major markets and seaports are provided below. A major market vicinity map is provided as **Appendix A.**

Time and Distance to Major Markets

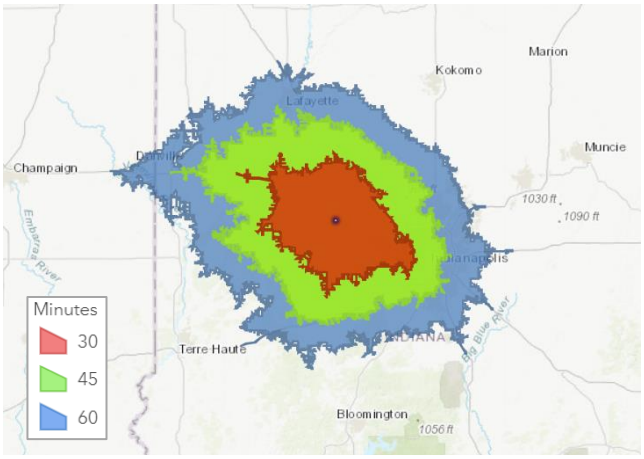

Major Markets	Travel Time	Miles
Indianapolis, IN	0:35	30.3
Cincinnati, OH	2:07	143
Louisville, KY	2:10	146
Fort Wayne, IN	2:18	152
Chicago, IL	2:45	168
Columbus, OH	3:04	206
Lexington, KY	3:20	220
Toledo, OH	3:40	253
St. Louis, MO	3:41	238
Milwaukee, WI	4:04	259
Detroit, MI	4:36	314
Nashville, TN	4:40	319
Cleveland, OH	5:12	347

Time and Distance to Ports

Ports of Indiana	Travel Time	Miles
Jeffersonville	2:08	143
Burns Harbor	2:25	148
Mount Vernon	3:15	213

Community

Community aspects conducive to site competitiveness include both measurable and intangible factors that can either strengthen or undermine a site's inherent competitive advantages. While workforce availability and cultural features are commonly accounted for, business and political climate are often neglected, yet serve as an important indicator for both community and governmental desire to welcome new business investment. The Boone County community and political leadership are strong proponents of business growth and new job creation, creating a business climate highly conducive to project investment support through efficient permitting, workforce training, and competitive tax structures. Boone County is committed to supporting long-term industrial and commercial business operations in its communities.

30, 45, 60-minute Drive-time Employment Query

Description of the Economy

Boone County is located in Indiana, a state that boasts a business-friendly environment, solid infrastructure, and substantial creation of manufacturing jobs. The county falls within the Central region of Indiana and has a population of 75,052 (US Census Bureau). Lebanon, the county seat, has a population of 16,840 (US Census Bureau). According to the Purdue Rural Indiana Classification System, Boone County is a Rural/Mixed county, which is defined as "rural with larger towns". The county is not considered urban, but its overall population and largest city's population is greater than that of a rural county. Boone County is part of the Indianapolis-Carmel-Muncie Metropolitan Statistical Area (MSA). As of 2020, the population of the MSA was 2,111,040, making it the 32nd-most populous metropolitan area in the United States and largest in the state of Indiana. Its economy is supported by local communities, nearby metropolitan areas, and a government favorable of business expansion and development. Further information about Boone County population and economic trends can be found in the 2009 Boone County Area Comprehensive Plan, provided as **Appendix D.**

Demographics

Boone County has a population density of approximately 158.4 persons per square mile (ppsm), compared to the state population density of 181 ppsm, and is the twenty-fourth most populated county in the State of Indiana. The population, considering race alone or in combination with one or more other races, is roughly 94.4% White, 2.4% Black or African American, 0.6% Native American, 3.5% Asian, and 0.8% some other race. Approximately 3.0% of the population are Hispanic or Latino. The county's median age is 38.1.

Employment and the Economy and Income

Boone County, IN is home to a total resident labor force of approximately 34,872 people. Unemployment (1.9%) is lower than the state average (4.8%). Educational Services and Health Care & Social Assistance; Manufacturing; and Professional, Scientific, & Management Services make up the largest industries in the county, employing 22.6%, 14.3%, and 14.3% of workers, respectively. Educational Services and Health Care & Social Assistance employs 7,733 people; Manufacturing employs 4,880 people; and Professional, Scientific, & Management Services employs 4,885 people. Median household income is $83,077, which is greater than the median annual household income of $62,843 across the United States.

Population/Workforce *within a 60-minute drive time from the site include a total population of more than 2,030,163 and 68,709-plus businesses employing over 1,048,114 people according to Esri 2022 demographic data. Construction, manufacturing, and professional, scientific, & technical services account for 19.8% of businesses employing 24.6% of total workforce within the 60-minute driving radius of the site.*
A 30, 45, and 60-minute drive-time query of employment numbers for construction and manufacturing jobs (by NAICS Code) was performed for the subject site. The following employment numbers were reported:

30, 45, 60-minute Drive-time Employment Count*

Business Type by NAICS Codes	Employees		
	30-min	45-min	60-min
Construction	9,923	30,387	61,964
Manufacturing	19,365	59,647	128,789
Professional, Scientific & Tech Services	7,857	32,382	72,806
Totals	**37,175**	**122,416**	**263,559**

**Source: Copyright 2022 Infogroup, Inc. All rights reserved. Esri Total Residential Population forecasts for 2022.*

Boone County target industries include manufacturing, professional and research, information technology, and agribusiness/agritourism. With access to a total workforce of over 1,072,963, which includes 263,559-plus employed in construction, manufacturing, and professional, scientific, and technical services sectors, adequate workforce availability should sufficiently meet medium to large-scale project labor demands of county industry targets. Access to a skilled workforce is considered a strength for the Jamestown Industrial Site. Population and business summary reports are provided in **Appendix I**.

Cultural Features within three miles of the subject site that may pose community risk or public opposition to industrial development are limited and generally do not affect site permitting, construction, or facility operation. Fire and police protection and emergency medical services are within relatively close distance to the subject site, but not close enough to pose cross-transportation risks for site construction or facility operation. A cultural features map is provided in **Appendix A**.

Schools are not located near the subject site. There is a single elementary school just outside of Jamestown called Granville Wells Elementary School. It is approximately 1.5 miles north of the subject site. With the site over a mile away and truck traffic having access to an Interstate and a US highway, the school should not pose any issues to site development.

Churches are primarily concentrated south of the site within a 1-mile radius. There are eight total churches within three miles of the subject site. Two of the churches are less than half a mile from the site boundary. One of these, Harvestime Fellowship, is located along Old Union Road across SR-75 and should be sufficiently removed from the operational footprint of the site (e.g., buildable area). As such, the site poses no significant operational proximity or transportation risks to this church. Jamestown Christian Church is located just southeast of the site. The church sports field backs up adjacent to the site's proposed buildable area boundary. It is LL+D's opinion that sufficient buffer should provide relief from noise and light pollution and facility line of sight from the vantage point of church location. Adequate distance and vegetative buffer should mediate most development objections. *LL+D recommends that at least a 605-foot long buffer consisting of newly planted evergreen and deciduous trees and shrubs native to the region be planted along the subject site property line that is adjacent to the church to provide the necessary vegetative buffering.*

Cemeteries existing immediately proximate to the site include the Independent Order of Odd Fellows Cemetery located 0.2 miles southeast of the site's buildable area. The cemetery is just south of Jamestown Christian Church along SR-75, a principal site access route. *LL+D recommends that a buffer consisting of newly planted evergreen and deciduous trees and shrubs native to the region be planted along the site buildable area's southeastern corner to provide additional vegetative buffering from the vantage point of cemetery location.*

Group Care Centers including nursing homes, assisted living centers, special education schools, crisis units, and hospice facilities do not exist immediately proximate to the site or along principal site access routes. There are no assisted living facilities located within 3 miles of the subject site. The nearest facility is a nursing and rehabilitation center located in the Town of Brownsburg, approximately 16.1 miles to the east of the subject site.

Other Cultural Centers including libraries, museums and art galleries, movie theaters and performing arts centers, zoos and aquariums, arboreta and botanical gardens, and planetariums do not exist immediately proximate to the site. The Tri-Area Public Library is in the Town of Jamestown and should pose no threat to industrial development.

Parks and Protected Lands do not exist immediately proximate to the site or along principal site access routes. The Pleasant Acres Nature Park is located approximately 0.7 miles south of the site in the Town of Jamestown. This area is sufficiently removed from the operational footprint of the site (e.g., buildable area). Site ingress/egress road access does not intersect or share park access. A protected lands map is provided in **Appendix A**.

Correctional Facilities including federal, state, and local prisons and detention centers do not exist immediately proximate to the site or along principal site access routes. The Montgomery County Jail is in the Town of Crawfordsville approximately 19.1 miles northwest of the site.

Fire Protection/EMS is provided by the Jamestown Fire Department located within 1.7 miles driving distance of the site access point. The response route is approximately 4-minutes, with trucks taking US-136 to SR-75 to Old Union Rd and directly to the site. The Advance Volunteer Fire Department is another further option located 10-minutes and 6.4 miles to the north of the site in the Town of Advance. The response route is from W 300 S to Main St/SR-75 to Old Union Rd and directly to the site. Fire and EMS response time and capacity should be locally verified.

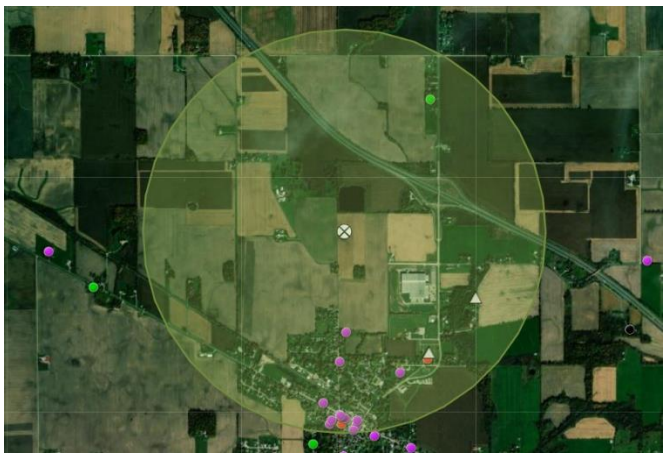

Law Enforcement is provided by the Lizton Police Department. It is an 8-minute and 6.4-mile drive to the site access point. The response route is Lebanon St to Brumfield St to N State St to I-74 to SR-75 and Old Union Rd directly to the site. Other options include the North Salem Police Department within 10 minutes and 6.3 miles, and the Ladoga Police Department within 14 minutes and 10.8 miles. The larger cities of Lebanon and Crawfordsville also house police departments and the Boone County and Montgomery County sheriff's offices, respectively. These are located within a 20-minute driving time of the site. Law enforcement response time and capacity should be locally verified.

Hospital/Emergency Care is not provided within 3-miles of the subject site. Medical emergencies can travel 15.5 miles (~24-minute drive time) northeast to the Witham Health Services Emergency Room Hospital in the City of Lebanon. Multiple services are available including an emergency department, occupational health services, surgery, and 48 private inpatient rooms. Another option is Franciscan Health in Crawfordsville, approximately 23.3 miles (~26-minute drive) from the site. The 103-bed hospital offers variety of inpatient and outpatient services and 24/7 emergency care. For minor emergencies, the Witham Health Services clinic is a closer option in the Town of Jamestown approximately 0.5 miles and a 1-minute drive away. For larger hospitals, emergencies must travel to the City of Indianapolis to either Sidney & Lois Eskenazi Hospital (28.5 miles and ~34-minute drive time) or IU Health University Hospital (28.3 miles and ~37-minute drive time). Sidney & Lois Eskenazi Hospital is a short acute care hospital with 333 total staffed beds. IU Health University Hospital is also a short acute care hospital and has 550 total staffed beds.

Historical Preservation records include locations of cultural or archaeological significance, some of which are formally designated as state and/or federally protected historical resources under State Historic Preservation Offices (SHPO) and/or National Register of Historic Places registrations. Historical resources, if located on the subject site, may alter, impede, or preclude development if potential for disturbance or encroachment exists. Historical resources located near the subject site may warrant mitigating site planning and design elements such as line-of-site buffering between facilities and a historically significant structure. The Indiana Department of Natural Resources (IDNR) houses the Division of Historic Preservation and Archaeology (DHPA), which promotes the conservation of Indiana's cultural resources. The DHPA facilitates state and federal preservation programs and is the staff of the State Historic Preservation Office. The DHPA's Archaeology Team administers programs for protecting and preserving Indiana's prehistoric and historic archaeological sites, is the central repository of archaeological records and reports, and houses the state's official computerized database of archaeological site information.

Several cultural resource GIS datasets from the IDNR were consulted for potential location of culturally or historically significant resources on or near the subject site. These datasets are collected and contained within the State Historic Architectural and Archaeological Research Database (SHAARD), which allows users to search cultural resource information on known historic and archaeological resources throughout the State of Indiana. SHAARD includes data from the Indiana Historic Sites and Structures Inventory county survey (IHSSI), the Indiana Cemetery and Burial Ground Registry, historic bridges and canals, historic theaters, and properties listed in the National Register of Historic Places and the Indiana Register of Historic Sites and Structures. The data contained in SHAARD was collected from previously conducted cultural resource inventories, National Register nominations, and cultural resource management projects. SHAARD and associated resource maps are ongoing initiatives and are updated daily, so the absence of data does not necessarily indicate the absence of resources. A more formal archaeological survey may be necessary prior to site development.

A desktop data review was conducted regarding available records for potential cultural resources present on the subject property. *The SHAARD database identified no archaeological sites and no historic structures on the subject site. Sixteen cultural resources were identified within a 1-mile radius of the subject site's centroid, including four houses, three farms, six commercial buildings, two churches, and a cemetery. The reported cultural resources are shown on the corresponding SHAARD web application map.* Of the sixteen IHSSI resources shown, two are considered "Outstanding", one is considered "Notable", and the remainder are considered "Contributing". An Outstanding rating means that the property has enough historic or architectural significance that it is already listed, or may be eligible for listing, in the National Register of Historic Places. A Notable rating means that the property did not quite merit an Outstanding rating but is above average in its importance. Properties with a Contributing rating hold less historic significance than the previously described ratings.

SHAARD Map Search

The majority of the observed cultural resources are located south of the site in Jamestown. One farm with a Contributing rating is adjacent to the site's southern boundary but should not be affected by onsite construction or present significant impediments to the development of the subject site. Adequate distance and buffer should exist between the cemetery southeast of the site boundary and the site potential area of development. However, LL+D recommends that additional vegetative buffer consisting of newly planted evergreen and deciduous trees and shrubs native to the region be planted along the site buildable area's southeastern boundary to provide relief from noise and light pollution and facility line of sight from the vantage point of cemetery location. All other historically significant resources are located outside the 1-mile buffer surrounding the subject site centroid and are not likely to impact site development potential. The SHAARD/IHSSI Reports for cultural resources with an Outstanding or Notable rating are provided as **Appendix K**, and the Historic Resource search map is provided as **Appendix A**.

As with any desktop research exercise, actual potential historic preservation concerns may not be fully recognized or understood without conducting an on-site field investigation. The industry standard for real estate environmental review is the Phase I Cultural Resources Survey. The primary objective of a Phase I archaeological survey is to identify and record all cultural resources within a project area. Cultural resources can include prehistoric Native American habitation sites, historic farmstead sites, standing structures, or other man-made features such as earthworks, old roadbeds, or cemeteries. The Phase I survey process typically begins with Phase IA Archaeological Reconnaissance to conduct historical research, environmental context review, and field inspection. When an archaeological site is encountered, a full written report must be submitted following guidance provided in the Current Guidebook for Indiana Historic Sites and Structures Inventory—Archaeological Sites and the Indiana Cultural Resources Manual.

Indiana Code 14-21-1 provides protection for archaeological sites and historic burial sites regardless of their location on state or private lands. All archaeological sites with artifacts dating before December 31, 1870 are protected under this act. Human burial sites are afforded protection under IC 14-21-1, IC 14-21-2, IC 23-14 (Indiana General Cemetery Act). The State of Indiana implements specialized reviews that provide protection to historic properties on state-owned or leased land or to historic properties that are listed in the National Register of Historic Places or the Indiana Register of Historic Sites and Structures and that will be altered, demolished, or removed using state funds. These review processes are established in Sections 14, 16, and 18 of Indiana Code 14-21-1. In addition, projects that will disturb the ground within 100 feet of a cemetery or burial ground for the purpose of excavating or covering the ground or erecting, altering, or repairing any structure are reviewed in Sections 26-26.5. In order to increase the confidence in understanding any potential historical preservation concerns for the subject site, it is recommended that a Phase I archaeological survey be conducted by a qualified cultural resource management/archaeological consulting professional and that archaeology state laws listed in Title 14, Article 21 of the Indiana Code are thoroughly understood. Relevant sections of the Indiana Code are provided as **Appendix K.** Information regarding Indiana Archaeology Law, complete with links to the full Indiana Code and Indiana Administrative Code, is also provided as **Appendix K.**

Education and Technical Training Assets are well positioned to serve professional and technical workforce needs of Boone County target industries, while colleges and universities provide valuable recruiting opportunities to local businesses.

The Indiana Department of Workforce Development (DWD) offers a variety of services to statewide job seekers looking to enter the workforce, return to the workforce, or locate education and training opportunities. These include Hoosier Talent Network, INDemand Jobs, Indiana Career Explorer, Indiana Career Connect, Cyberseek Indiana, and Indiana Career Ready. The DWD offers several services including job search help, hiring events, training grants, specialized training and more: https://www.in.gov/dwd/.

Indiana's WorkOne Career Centers are the heart of the workforce development system, providing assistance in understanding jobs in demand today, helping workers determine their interests and abilities, offering access to training opportunities, and providing information needed to succeed in today's economy. WorkOne's Job Opportunities and Business Services (JOBS) Program assists employers in locating and developing a skilled team by determining eligibility, recruiting employees, formulating WorkKeys job profiles, and providing skills assessments to identify gaps and training needs. WorkOne's WIN Career Readiness is a fundamental workplace skills training system available to Indiana residents, employers and training providers. Both the DWD's Work Opportunity Tax Credit (WOTC) and Federal

Bonding Program benefits employers by offering incentives for hiring jobseekers who may traditionally have difficulty finding employment.

Next Level Jobs provides free training for Indiana workers and reimbursements for Indiana employers for training employees in high-demand fields. Next Level Jobs assists job seekers by providing Indiana residents with free training in high-growth job fields and the opportunity for them to earn a high-value certificate in one of Indiana's in-demand job fields, tuition free. Next Level Jobs assists employers with reimbursements for training their employees through the Employer Training Grant, which will reimburse an employer for up to $5,000 per trained employee who is trained, hired, and retained for six months, granting up to $50,000 per employer.

Ivy Tech Community College is a two-year vocational/technical college with locations surrounding the site. There are several Ivy Tech campuses within an hour drive of the site in Indianapolis and surrounding areas, as well as in the cities of Crawfordsville, Greencastle, and Lafayette. The closest campuses are in Crawfordsville and Indianapolis (approximately 23 miles and 29 miles from the subject site, respectively). Ivy Tech specializes in developing programs geared towards specific skills needed for existing manufacturers and other industries.

Other higher education centers within 45 miles of the subject site include several institutions throughout the Indianapolis area and its outskirts such as Indiana University–Purdue University Indianapolis, Butler University, University of Indianapolis, Martin University, Marian University's Saint Joseph's College, Lincoln College of Technology, Indiana Tech, and South College Indianapolis. Wabash College in Crawfordsville, IN and DePauw University in Greencastle, IN are also within a 45-mile reach of the site.

Business Climate is highly favorable for bringing in quality job-creating businesses to the area. Indiana is considered one of the best states in the nation for long-term fiscal stability and low corporate income tax rates, creating a business-forward environment throughout the state. The State of Indiana's target Industries according to the IEDC include advanced manufacturing, aerospace and aviation, ag-bioscience, defense, life sciences, logistics and transportation, and technology. These industries can take advantage of existing transportation assets throughout the state and county to serve an array of unique business logistical needs. The following target industries are listed by Boone County officials: manufacturing, professional and research, information technology, and agribusiness/agritourism.

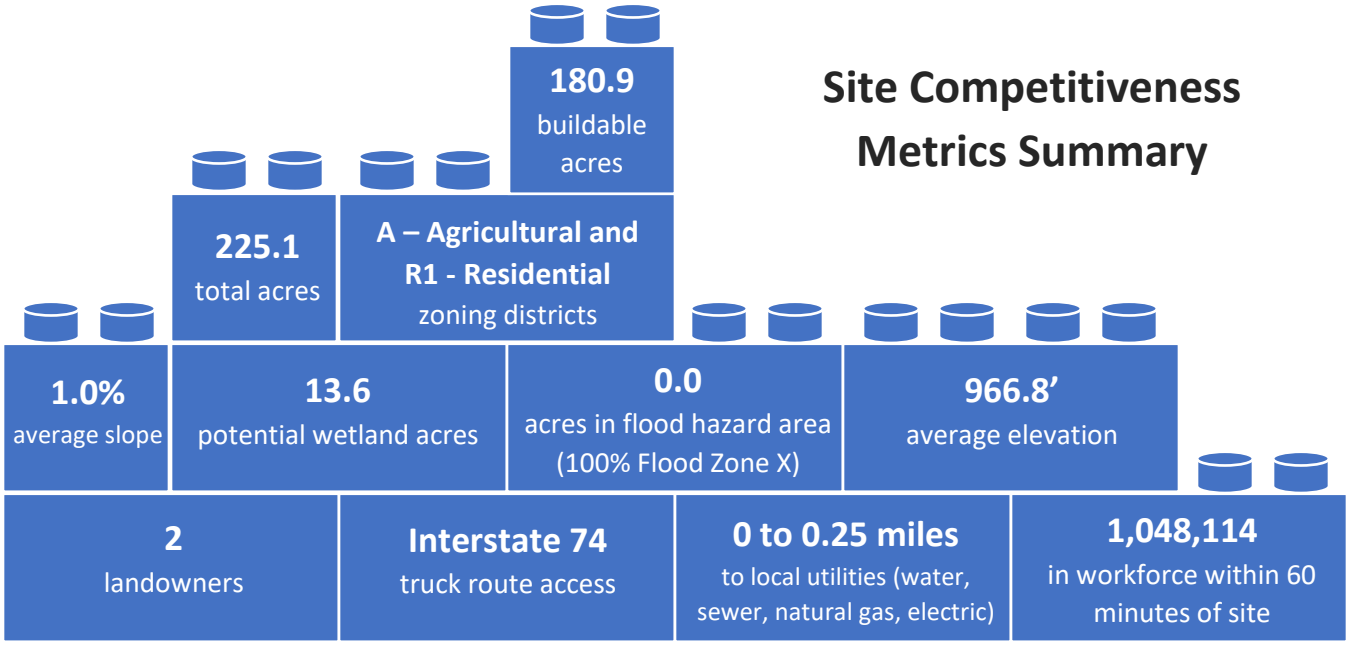

Boone County has a labor force of 34,962 and an unemployment rate of 1.9%. Business development and assistance is provided locally by Boone County Economic Development Corporation (Boone EDC). Local incentives are primarily real & personal property abatement offered by the local government and recommended by the Boone EDC. Additionally, bonds, training grants, moving assistance, and infrastructure have been provided as incentives in the past. Each project is handled on a case-by-case basis as determined by the county, and the approval process for all local incentives are dependent on project and municipality.

In addition, the IEDC provides for a variety of programs and initiatives offering business support and expertise to companies that are investing and creating jobs in Indiana. These include the Indiana Regional

Cities Initiative, Certified Technology Park program, Broadband Ready Communities program, and Next Level Roads program.

The State of Indiana offers a variety of incentives for all types of businesses, including targeted industries, workforce training, infrastructure, and special opportunity incentives. Indiana's business tax structure is competitive—the corporate income tax is decreasing to 4.9%, and the state offers many business tax incentives, corporate tax credits and economic development programs. Statewide incentives include the Community Revitalization Enhancement District (CRED) Tax Credit, Data Center Gross Retail and Use Tax Exemption, Economic Development for a Growing Economy (EDGE) Tax Credit, Industrial Grant Fund (IDGF), Tax Exemption for Patent-derived Income, Skills Enhancement Fund (SEF), Venture Capital Investment Tax Credit program, Hoosier Business Investment (HBI) Tax Credit, Research Expense Credits, Research and Development Sales Tax Exemption, and Redevelopment Tax Credit (RTC).

Political Climate is strong according to interviews with local officials, and the community is largely in favor of commercial/industrial business development to bring long-term positive economic growth to the area.

Site Competitiveness Report Card

The Site Competitiveness Report Card is an indicator of favorable development conditions across customary competitiveness factors. A relative score for each factor is given as a letter grade, akin to a 4.0 education grade point average (GPA). The GPA is calculated for each competitiveness area: Condition, Connection, and Community with an overall site GPA derived as a relative indicator of site competitiveness for an economic development land use.

Subject Site Key Facts

Advantages	Disadvantages
A large buildable area of just over 180 contiguous acres (180.9 acres) is available.	As of the date of this report, no known real estate purchase option agreement is held with any person or organization with the landowners for any portion of the site. It is also known that the Purdy-owned parcel (Parcel Number 0050624000) contains the owner's farm and may present challenges regarding desire to sell. LL+D strongly recommends that Boone County pursue and secure a real estate purchase option agreement with the landowners. This is critically important to reduce uncertainty regarding property availability and price.
The site has low flood risk, no recorded or observed hydrography features, and minimal wetlands across the entirety of the buildable area.	
Boone County community and political leadership are strong proponents of business growth and new job creation creating a business climate highly conductive to project investment.	According to the SSURGO Hydrologic Soil Group map, 68.6% of the total site has soils estimated to have hydric components.
The surrounding land use is ideal to support the development of light industrial, agribusiness, and R&D Technology park project land uses.	Soil suitability properties for small commercial building construction across 85.9% (193.5 acres) of the subject site are indicated as "Very limited" for shallow (2-feet deep) reinforced concrete spread footings. Substantial foundation requirements may not be supported by site soil conditions and must be determined through on-site geotechnical engineering investigation.
Within close reach of direct interstate access (I-74) via an adequate state highway (SR-75) for truck traffic ingress/egress.	
The site is well connected to all utility infrastructure assets (electric, natural gas, wastewater, potable water, and telecom).	The site is zoned as Agricultural and Residential and should be rezoned to Industrial. Tracts surrounding the subject site, and especially the buildable area, should be considered for rezoning with uses that are compatible with the intended industrial uses of the site. Compatibility with surrounding land use is vital to preserving the competitiveness of the site for an economic development use by preventing encroachment of land uses that would create real or perceived risk to prospective business considering the site for development.
The site is flat with minimal changes in elevation and an average slope of 1%.	
Access to surrounding labor markets at competitive wage rates is well within reach of the subject site.	
There is a very high workforce population relative to other counties in Indiana, with greater than 1,100,000 within a 60-minute drive time of the site.	

Rough Order-of-Magnitude Site Development Cost Summary

A rough order-of-magnitude (ROM) cost estimation for pre-construction site preparation and utility and transportation infrastructure improvements was calculated to provide a general understanding of potential site development costs. ROM costs were calculated for the 180.9-acre buildable area, which was devised to avoid more costly site leveling due to elevation/slope conditions occurring on the eastern-southeastern perimeter of the site. ROM cost tables for the buildable area are presented below.

Notes:

- *Does not include costs for engineering, permitting, or general project management.*
- *This cost estimate was prepared with the best information available at the time of analysis.*
- *Actual costs can vary based on availability of material, site conditions, and labor.*
- *ROM costs generated from GIS data and use of RSMeans construction cost estimating software.*

ROM Costs for 18011-002 Buildable Area (180.9 acres)

Project: 18011-002
Location: Boone County, IN

WORK ACTIVITY	QUANTITY	UNIT	UNIT COST	SUBTOTAL	TOTAL
ON-SITE PREPARATION					
Site Clearing					
Mobilization	1.00	EA	$80,000.00	$80,000.00	
Demolition (Structure)	0.00	EA	$25,000.00	$25,000.00

			Construction Contingency	10%	$442,422.79
			Total Cost Estimate For Site Construction w/o Mitigation		**$4,866,650.74**
			Total Cost Estimate For Site Construction with Mitigation		**$6,369,242.74**
SOFT COSTS					
Engineering				5.00%	$243,332.54
Surveying & Staking				2.50%	$121,666.27
Testing & Inspecting				1.00%	$48,666.51
Construction Management				4.75%	$231,165.91
Studies					$100,000.00
			TOTAL		**$744,831.22**
			Total Cost Estimate For Site		**$7,114,073.96**

*****_ROM costs are intended to estimate the rough order of magnitude costs to bring the site to a project construction ready pad with utilities, entrances, off-site improvements, drainage, and grading. This does not include any project specifics regarding design, facilities, construction within the PAD, impact fees, regulatory requirements, entitlement costs, etc. These costs were based on information provided within the report and assume a ~180.9-acre PAD (excluding required open space, buffers, storm water management, and site access)._

Site Competitiveness Opinion

Overall, the Jamestown Industrial Site in Boone County is a competitive greenfield site that is a good prospect for industrial, agribusiness, and R&D technology park project opportunities.

The site has several competitive features that position it as a strategic real estate asset to support economic development. Firstly, the site is within proximity to all major utilities including electricity, natural gas, wastewater & sewer, potable water, and broadband/fiber. A few improvements are needed: natural gas could need a 1,400' extension to reach the site and electric capacity will likely need to be increased by WVPA. Another strength for the site is that it contains a large contiguous PAD of just above 180 acres that is mostly flat, has low flood risk, no observed hydrography features, and minimal wetlands across the entirety of the buildable area. The property is also located in an area with surrounding land use that is ideal to support the development of industrial/manufacturing, agribusiness, and R&D tech park project land uses. The Fukai Toyotetsu Indiana Corp (FTIC) manufacturing plant is located just southeast of the site and should make a good neighbor in a new industrial area. The primary access road, Indiana State Road 75 (SR-75), a two-lane principal arterial highway, is an adequate transportation route that connects the site to Interstate 74 (I-74). From there truck traffic can quickly reach Indianapolis and multiple different interstates and truck routes. With interstate access and the nearby metropolitan city of Indianapolis, a skilled workforce of over 1.1 million is available within a 60-minute drivetime. Finally, Boone County community and political leadership are strong proponents of business growth and new job creation creating a business climate highly conductive to project investment.

Some challenges for the site also exist, including lack of landowner engagement, on-site soil conditions, and rezoning needs. As of the date of this report, no known real estate purchase option agreement is held with any person or organization with the landowners for any portion of the site. It is also known that the Purdy-owned parcel (Parcel Number 0050624000) contains the owner's farm and may present challenges regarding desire to sell. LL+D strongly recommends that Boone County pursue and secure a real estate purchase option agreement with the landowners. This is critically important to reduce uncertainty regarding property availability and price. Another potential challenge for the site is poorly draining soils found throughout nearly 85% of the property. Substantial foundation requirements may not be supported by site soil conditions and must be determined through on-site geotechnical engineering investigation. The limitations can be overcome or minimized by special planning, design, or installation. Another challenge is a nearby church and cemetery located just south of the site. To remediate this issue, LL+D recommends that at least a 605-foot long buffer consisting of newly planted evergreen and deciduous trees and shrubs native to the region be planted along the subject site property line that is adjacent to the church to provide the necessary vegetative buffering. Finally, the site is zoned as Agricultural and Residential and should be rezoned to Industrial. Tracts surrounding the subject site, and especially the buildable area, should be considered for rezoning with uses that are compatible with the intended industrial uses of the site. Compatibility with surrounding land use is vital to preserving the competitiveness of the site for an economic development use by preventing encroachment of land uses that would create real or perceived risk to prospective business considering the site for development.

Upon considering the factors mentioned throughout the SSI Phase II Report, it is the opinion of LL+D that the Jamestown Industrial Site should be considered a nationally competitive site for attracting quality job-producing light industrial and general agribusiness projects to Boone County. With nearby access to all major utilities, a PAD of over 180 acres, direct interstate access, high available workforce within 60-minutes, community support and political leadership from Boone County, the property should be considered a high-quality site that is prime for development.

Purpose and Use of Study

Sites originating from Phase I have demonstrated qualitative compliance with engineering. environmental, infrastructure, and cultural location criteria. That said, in order to develop an actionable understanding of true site competitiveness, a more detailed study of the subject site is required. SSI Phase II: Preliminary Due Diligence is designed for this purpose.

Purpose

The purpose of the SSI Phase II study is to provide an understanding of the subject site's advantages and challenges in conjunction with a ROM cost estimate to improve site functional use and mitigate development challenges. The SSI Phase II study is a desktop-based preliminary due diligence exercise performed by discipline-specific experts with experience in industrial and commercial property development. Study of the subject site's physical and surrounding characteristics, assets, and impediments for development are reviewed in sufficient detail to formulate a defendable opinion on the competitive value of the property for economic development.

Use

There are three primary intended uses of an SSI Phase II report: (1) site advancement decision support; (2) consideration for investment in site improvements; and (3) site marketing. Each intended use is discussed below.

Site Advancement Decision

The SSI Phase II study is designed to provide decision support for the advancement of sites to market though the landowner engagement process. SSI Phase II findings serve as an indicator for the likelihood the subject site will survive the intensive scrutiny of formal, field-based engineering and environmental due diligence. Detection of severe site deficiencies or encumbrances, often referred to as fatal flaws, during desktop preliminary due diligence can avoid expenditure of significant resources in subjecting sites with little chance of survival to formal due diligence. Short of fatal flaws, SSI Phase II may reveal less than ideal conditions or less severe yet concerning challenges that can marginalize site competitiveness or be detrimental to business attraction, respectively. The most important use of the SSI Phase II study is to ensure confidence in the decision to advance sites to market graduation through subsequent phases for landowner engagement and formal due diligence. *Ultimately, site advancement decisions should be tempered by local industry targets and the host community's real estate needs to support those targets.*

Site Improvement Investment Considerations

The findings of the Phase II study, along with an estimate of the ROM costs needed to make functional site and infrastructure improvements, provides concrete data for Economic Development Offices (EDOs) to consider while making investment decisions to improve site marketability. There may be strong business cases for increasing site competitiveness by making incremental investment in infrastructure improvements or mitigation of development challenges. There are many conditions to be considered in investing significant dollars on speculative site improvements including market, economic, fiscal, real estate, and political factors. While the information provided through the SSI Phase II study should not be exclusively considered for site improvement expenditures, the findings may provide an initial quasi prospectus on site development expenditure and associated return-on-investment (ROI).

Site Marketing

The best greenfield site in America is of no consequence to the host community if industry prospects are unaware of its value and availability. Many EDOs invest in branding and marketing campaigns to showcase their community's differentiating attributes to attract business investment. If prematurely launched, many communities unfortunately become "the dog that caught the car". The well-qualified community successfully attracts the serious interest of a prospective company only to lose the project, and possibly credibility for future projects, because it fails to offer a competitive site.

It is the opinion of LL+D, based on extensive industrial and commercial site selection experience, that the methodology, objectivity, and level of detail and completeness provided in this report are sufficient to support the competitive claims of the subject site for its intended project land use(s). Accordingly, the information contained in this report can and should be used to supplement site marketing materials, specifically for RFI responses and proactive target industry solicitations. However, EDOs should exercise judicious use of SSI Phase II site information for the purposes of site marketing in advance of formal landowner engagement and security of real estate purchase opinion. The real estate purchase option is pursued during SSI Phase III: Landowner Engagement.

Warranty

All Phase II project tasks are intended to serve as an informed guide to determination of site advancement to the formal due diligence phase of inventory development. All information and opinions provided in this report are limited to planning-level engineering and environmental considerations and do not rise to the investigative level of study for site design uses.

All data used in this study originates from public domain sources. All findings derived from the use of public domain data are subject to potential errors and omissions inherent digital data sets which may include spatial and attribute accuracy, completeness, and currency. Data and other information cited in this study has not been verified for quality of accuracy. As such, the confidence in findings provided herein and corresponding opinions are subject to the limitations of the data and other information sources consulted in the conduct of this study.

Ultimate site development potential and fatal flaw analysis cannot be determined without physically visiting the site and conducting formal engineering and environmental due diligence. However, Leotta Location and Design is confident that our site screening methodology is highly effective in eliminating low quality or practically undevelopable sites and presents candidate sites with a high likelihood of confirming results through more formal engineering and environmental due diligence.
